6 Topic Documentation 11

6.1 Clock Management Commands . . . 11

6.1.1 Detailed Description . . . 11

6.1.2 Function Documentation . . . 11

6.1.2.1 handle_time() . . . 11

6.1.2.2 handle_timezone_offset() . . . 12

6.1.2.3 handle_clock_sync_interval() . . . 13

6.1.2.4 handle_get_last_sync_time() . . . 14

6.1.3 Variable Documentation . . . 14

6.1.3.1 systemClock . . . 14

6.2 Command System . . . 14

6.2.1 Detailed Description . . . 15

6.2.2 Typedef Documentation . . . 15

6.2.2.1 CommandHandler . . . 15

6.2.2.2 CommandMap . . . 15

6.2.3 Function Documentation . . . 15

6.2.3.1 execute_command() . . . 15

6.2.4 Variable Documentation . . . 16

6.2.4.1 commandHandlers . . . 16

6.3 Diagnostic Commands . . . 17

6.3.1 Detailed Description . . . 17

6.3.2 Function Documentation . . . 17

6.3.2.1 handle_get_commands_list() . . . 17

6.3.2.2 handle_get_build_version() . . . 18

6.3.2.3 handle_verbosity() . . . 19

6.3.2.4 handle_enter_bootloader_mode() . . . 20

6.4 Event Commands . . . 21

6.4.1 Detailed Description . . . 21

6.4.2 Function Documentation . . . 21

6.4.2.1 handle_get_last_events() . . . 21

6.4.2.2 hadnle_get_event_count() . . . 22
6.5 GPS Commands . . . 23
6.5.1 Detailed Description . . . 23
6.5.2 Function Documentation . . . 23
6.5.2.1 handle_gps_power_status() . . . 23
6.5.2.2 handle_enable_gps_uart_passthrough() . . . 24
6.5.2.3 handle_get_rmc_data() . . . 25
6.5.2.4 handle_get_gga_data() . . . 26
6.6 Power Commands . . . 27
6.6.1 Detailed Description . . . 27
6.6.2 Function Documentation . . . 27
6.6.2.1 handle_get_power_manager_ids() . . . 27
6.6.2.2 handle_get_voltage_battery() . . . 28
6.6.2.3 handle_get_voltage_5v() . . . 29
6.6.2.4 handle_get_current_charge_usb() . . . 29
6.6.2.5 handle_get_current_charge_solar() . . . 30
6.6.2.6 handle_get_current_charge_total() . . . 31
6.6.2.7 handle_get_current_draw() . . . 32
6.7 Storage Commands . . . 33
6.7.1 Detailed Description . . . 33
6.7.2 Function Documentation . . . 33
6.7.2.1 handle_file_download() . . . 33
6.7.2.2 handle_list_files() . . . 34
6.8 INA3221 Power Monitor . . . 35
6.8.1 Detailed Description . . . 36
6.8.2 Configuration Functions . . . 36
6.8.2.1 Detailed Description . . . 37
6.8.2.2 Function Documentation . . . 37
6.8.3 Measurement Functions . . . 45
6.8.3.1 Detailed Description . . . 45
6.8.3.2 Function Documentation . . . 45
6.8.4 Alert Functions . . . 47
6.8.4.1 Detailed Description . . . 48
6.8.4.2 Function Documentation . . . 48

Topic Index

2.1 Topics

Here is a list of all topics with brief descriptions:

Clock Management Commands 11
Command System 14
Diagnostic Commands 17
Event Commands 21
GPS Commands 23
Power Commands 27
Storage Commands 33
INA3221 Power Monitor 35
- Configuration Functions 36
- Measurement Functions 45
- Alert Functions 47

Chapter 3

Hierarchical Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

BH1750 55
BME280 61
BME280CalibParam 70
INA3221::conf_reg_t 76
DS3231 78
ds3231_data_t 85
ErriezDS3231 87
EventEmitter 102
EventLog 103
EventManager 105
    EventManagerImpl 111
FileHandle 114
Frame 115
HMC5883L 117
INA3221 122
ISensor 128
    BH1750Wrapper 58
    BME280Wrapper 73
    HMC5883LWrapper 120
    MPU6050Wrapper 161
INA3221::masken_reg_t 158
NMEAData 164
PowerManager 166
Print 172
    LoRaClass 130
SensorWrapper 192

Chapter 4

Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

BH1750 55
BH1750Wrapper 58
BME280 61
BME280CalibParam 70
BME280Wrapper 73
INA3221::conf_reg_t
Configuration register bit fields 76
DS3231 78
ds3231_data_t 85
ErriezDS3231
DS3231 RTC class 87
EventEmitter
Provides a static method for emitting events 102
EventLog
Represents a single event log entry 103
EventManager
Manages the event logging system 105
EventManagerImpl
Implementation of the EventManager class 111
FileHandle 114
Frame 115
HMC5883L 117
HMC5883LWrapper 120
INA3221
INA3221 Triple-Channel Power Monitor driver class 122
ISensor 128
LoRaClass 130
INA3221::masken_reg_t
Mask/Enable register bit fields 158
MPU6050Wrapper 161
NMEAData 164
PowerManager 166
Print 172
SensorWrapper
Manages different sensor types and provides a unified interface for accessing sensor data . . 192

Chapter 6

Topic Documentation

6.1 Clock Management Commands

Commands for managing system time and clock settings.

Functions

- Frame handle_time (const std::string &param, OperationType operationType)

  Handler for getting and setting system time.
- Frame handle_timezone_offset (const std::string &param, OperationType operationType)

  Handler for getting and setting timezone offset.
- Frame handle_clock_sync_interval (const std::string &param, OperationType operationType)

  Handler for getting and setting clock synchronization interval.
- Frame handle_get_last_sync_time (const std::string &param, OperationType operationType)

  Handler for getting last clock sync time.

Variables

- DS3231 systemClock

6.1.1 Detailed Description

Commands for managing system time and clock settings.

6.1.2 Function Documentation

6.1.2.1 handle_time()

```
Frame handle_time (
            const std::string & param,
            OperationType operationType)
```

Handler for getting and setting system time.

Parameters

param	For SET: Unix timestamp as string, for GET: empty string
operationType	GET/SET

Returns

Frame containing success/error and current time or confirmation

Note

GET: **KBST;0;GET;3;0;;KBST**

When getting time, returns format "HH:MM:SS Weekday DD.MM.YYYY"

SET: **KBST;0;SET;3;0;TIMESTAMP;KBST**

When setting time, expects Unix timestamp as parameter

Command Command ID: 3.0

Definition at line 26 of file clock_commands.cpp.

Here is the call graph for this function:

6.1.2.2 handle_timezone_offset()

```
Frame handle_timezone_offset (
            const std::string & param,
            OperationType operationType)
```

Handler for getting and setting timezone offset.

Parameters

param	For SET: Timezone offset in minutes (-720 to +720), for GET: empty string
operationType	GET/SET

Returns

Frame containing success/error and timezone offset in minutes

Note

GET: **KBST;0;GET;3;1;;KBST**

SET: **KBST;0;SET;3;1;OFFSET;KBST**

Command Command ID: 3.1

Definition at line 80 of file clock_commands.cpp.

Here is the call graph for this function:

6.1.2.3 handle_clock_sync_interval()

```
Frame handle_clock_sync_interval (
            const std::string & param,
            OperationType operationType)
```

Handler for getting and setting clock synchronization interval.

Parameters

param	For SET: Sync interval in seconds, for GET: empty string
operationType	GET/SET

Returns

Frame containing success/error and sync interval in seconds

Note

GET: **KBST;0;GET;3;3;;KBST**

SET: **KBST;0;SET;3;3;INTERVAL;KBST**

Command Command ID: 3.3

Definition at line 124 of file clock_commands.cpp.

Here is the call graph for this function:

6.1.2.4 handle_get_last_sync_time()

```
Frame handle_get_last_sync_time (
            const std::string & param,
            OperationType operationType)
```

Handler for getting last clock sync time.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing success/error and last sync time as Unix timestamp

Note

KBST;0;GET;3;7;;KBST

Command Command ID: 3.7

Definition at line 164 of file clock_commands.cpp.

Here is the call graph for this function:

6.1.3 Variable Documentation

6.1.3.1 systemClock

```
DS3231 systemClock [extern]
```

6.2 Command System

Core command system implementation.

Typedefs

- using CommandHandler = std::function<Frame(const std::string&, OperationType)>

  Function type for command handlers.
- using CommandMap = std::map<uint32_t, CommandHandler>

  Map type for storing command handlers.

Functions

- Frame execute_command (uint32_t commandKey, const std::string &param, OperationType operationType)

  Executes a command based on its key.

Variables

- CommandMap commandHandlers

  Global map of all command handlers.

6.2.1 Detailed Description

Core command system implementation.

6.2.2 Typedef Documentation

6.2.2.1 CommandHandler

```
using CommandHandler = std::function<Frame(const std::string&, OperationType)>
```

Function type for command handlers.

Definition at line 15 of file commands.cpp.

6.2.2.2 CommandMap

```
using CommandMap = std::map<uint32_t, CommandHandler>
```

Map type for storing command handlers.

Definition at line 21 of file commands.cpp.

6.2.3 Function Documentation

6.2.3.1 execute_command()

```
Frame execute_command (
            uint32_t commandKey,
            const std::string & param,
            OperationType operationType)
```

Executes a command based on its key.

Parameters

commandKey	Combined group and command ID (group << 8 | command)
param	Command parameter string
operationType	Operation type (GET/SET)

Returns

Frame Response frame containing execution result

Looks up the command handler in commandHandlers map and executes it

Definition at line 62 of file commands.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

6.2.4 Variable Documentation

6.2.4.1 commandHandlers

```
CommandMap commandHandlers
```

Initial value:

```
= {
    {((static_cast<uint32_t>(1) « 8) | static_cast<uint32_t>(0)), handle_get_commands_list},
    {((static_cast<uint32_t>(1) « 8) | static_cast<uint32_t>(1)), handle_get_build_version},
    {((static_cast<uint32_t>(1) « 8) | static_cast<uint32_t>(8)), handle_verbosity},
    {((static_cast<uint32_t>(1) « 8) | static_cast<uint32_t>(9)), handle_enter_bootloader_mode},
    {((static_cast<uint32_t>(2) « 8) | static_cast<uint32_t>(0)), handle_get_power_manager_ids},
    {((static_cast<uint32_t>(2) « 8) | static_cast<uint32_t>(2)), handle_get_voltage_battery},
    {((static_cast<uint32_t>(2) « 8) | static_cast<uint32_t>(3)), handle_get_voltage_5v},

    {((static_cast<uint32_t>(2) « 8) | static_cast<uint32_t>(5)), handle_get_current_charge_solar},
    {((static_cast<uint32_t>(2) « 8) | static_cast<uint32_t>(6)), handle_get_current_charge_total},
```

```
    {((static_cast<uint32_t>(2) « 8) | static_cast<uint32_t>(7)), handle_get_current_draw},
    {((static_cast<uint32_t>(3) « 8) | static_cast<uint32_t>(0)), handle_time},
    {((static_cast<uint32_t>(3) « 8) | static_cast<uint32_t>(1)), handle_timezone_offset},
    {((static_cast<uint32_t>(3) « 8) | static_cast<uint32_t>(2)), handle_clock_sync_interval},
    {((static_cast<uint32_t>(3) « 8) | static_cast<uint32_t>(3)), handle_get_last_sync_time},
    {((static_cast<uint32_t>(5) « 8) | static_cast<uint32_t>(1)), handle_get_last_events},
    {((static_cast<uint32_t>(5) « 8) | static_cast<uint32_t>(2)), hadnle_get_event_count},
    {((static_cast<uint32_t>(6) « 8) | static_cast<uint32_t>(0)), handle_list_files},
    {((static_cast<uint32_t>(6) « 8) | static_cast<uint32_t>(1)), handle_file_download},
    {((static_cast<uint32_t>(7) « 8) | static_cast<uint32_t>(1)), handle_gps_power_status},
    {((static_cast<uint32_t>(7) « 8) | static_cast<uint32_t>(2)), handle_enable_gps_uart_passthrough},
    {((static_cast<uint32_t>(7) « 8) | static_cast<uint32_t>(3)), handle_get_rmc_data},
    {((static_cast<uint32_t>(7) « 8) | static_cast<uint32_t>(4)), handle_get_gga_data},
}
```

Global map of all command handlers.

Maps command keys (group << 8 | command) to their handler functions

Definition at line 27 of file commands.cpp.

6.3 Diagnostic Commands

Functions

- Frame handle_get_commands_list (const std::string &param, OperationType operationType)

  Handler for listing all available commands on UART.
- Frame handle_get_build_version (const std::string &param, OperationType operationType)

  Get firmware build version.
- Frame handle_verbosity (const std::string &param, OperationType operationType)

  Handles setting or getting the UART verbosity level.
- Frame handle_enter_bootloader_mode (const std::string &param, OperationType operationType)

  Reboot system to USB firmware loader.

6.3.1 Detailed Description

6.3.2 Function Documentation

6.3.2.1 handle_get_commands_list()

```
Frame handle_get_commands_list (
            const std::string & param,
            OperationType operationType)
```

Handler for listing all available commands on UART.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing success/error and command list

Note

KBST;0;GET;1;0;;TSBK

Print all available commands on UART port

Command Command ID: 0

Definition at line 21 of file diagnostic_commands.cpp.

Here is the call graph for this function:

6.3.2.2 handle_get_build_version()

```
Frame handle_get_build_version (
            const std::string & param,
            OperationType operationType)
```

Get firmware build version.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing build number

Note

KBST;0;GET;1;1;;TSBK

Get the firmware build version

Command Command ID: 1

Definition at line 56 of file diagnostic_commands.cpp.

Here is the call graph for this function:

6.3.2.3 handle_verbosity()

```
Frame handle_verbosity (
            const std::string & param,
            OperationType operationType)
```

Handles setting or getting the UART verbosity level.

This function allows the user to either retrieve the current UART verbosity level or set a new verbosity level.

Parameters

param	The desired verbosity level (0-5) as a string. If empty, the current level is returned.
operationType	The operation type. Must be GET to retrieve the current level, or SET to set a new level.

Returns

A Frame indicating the result of the operation.

- Success (GET): Frame containing the current verbosity level.
- Success (SET): Frame with "LEVEL SET" message.
- Error: Frame with error message (e.g., "INVALID LEVEL (0-5)", "INVALID FORMAT").

Note

KBST;0;GET;1;8;;TSBK - Gets the current verbosity level.

KBST;0;SET;1;8;[level];TSBK - Sets the verbosity level.

Example: **KBST;0;SET;1;8;2;TSBK** - Sets the verbosity level to 2.

Command Command ID: 1.8

Definition at line 88 of file diagnostic_commands.cpp.

Here is the call graph for this function:

6.3.2.4 handle_enter_bootloader_mode()

```
Frame handle_enter_bootloader_mode (
            const std::string & param,
            OperationType operationType)
```

Reboot system to USB firmware loader.

Parameters

param	Empty string expected
operationType	Must be SET

Returns

Frame with operation result

Note

KBST;0;SET;1;9;;TSBK

Reboot the system to USB firmware loader

Command Command ID: 2

Definition at line 117 of file diagnostic_commands.cpp.

Here is the call graph for this function:

6.4 Event Commands

Commands for accessing and managing system event logs.

Functions

- Frame handle_get_last_events (const std::string &param, OperationType operationType)

  Handler for retrieving last N events from the event log.
- Frame hadnle_get_event_count (const std::string &param, OperationType operationType)

  Handler for getting total number of events in the log.

6.4.1 Detailed Description

Commands for accessing and managing system event logs.

6.4.2 Function Documentation

6.4.2.1 handle_get_last_events()

```
Frame handle_get_last_events (
            const std::string & param,
            OperationType operationType)
```

Handler for retrieving last N events from the event log.

Parameters

param	Number of events to retrieve (optional, default 10)
operationType	GET

Returns

Frame containing:

- Success: Hex-encoded events in format IIIITTTTTTTTGGEE separated by '-' where:
  - IIII: Event ID (16-bit)
  - TTTTTTTT: Unix Timestamp (32-bit)
  - GG: Event Group (8-bit)
  - EE: Event Type (8-bit)
- Error: "INVALID OPERATION", "INVALID COUNT", or "INVALID PARAMETER"

Note

KBST;0;GET;5;1;20;TSBK

Returns up to 10 most recent events

Command Command ID: 5.1

Definition at line 29 of file event_commands.cpp.

Here is the call graph for this function:

6.4.2.2 hadnle_get_event_count()

```
Frame hadnle_get_event_count (
            const std::string & param,
            OperationType operationType)
```

Handler for getting total number of events in the log.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: Number of events currently in the log
- Error: "INVALID REQUEST"

Note

KBST;0;GET;5;2;;TSBK

Returns the total number of events in the log

Command Command ID: 5.2

Definition at line 83 of file event_commands.cpp.

Here is the call graph for this function:

6.5 GPS Commands

Commands for controlling and monitoring the GPS module.

Functions

- Frame handle_gps_power_status (const std::string &param, OperationType operationType)

  Handler for controlling GPS module power state.
- Frame handle_enable_gps_uart_passthrough (const std::string &param, OperationType operationType)

  Handler for enabling GPS transparent mode (UART pass-through)
- Frame handle_get_rmc_data (const std::string &param, OperationType operationType)

  Handler for retrieving GPS RMC (Recommended Minimum Navigation) data.
- Frame handle_get_gga_data (const std::string &param, OperationType operationType)

  Handler for retrieving GPS GGA (Global Positioning System Fix Data) data.

6.5.1 Detailed Description

Commands for controlling and monitoring the GPS module.

6.5.2 Function Documentation

6.5.2.1 handle_gps_power_status()

```
Frame handle_gps_power_status (
            const std::string & param,
            OperationType operationType)
```

Handler for controlling GPS module power state.

Parameters

param	For SET: "0" to power off, "1" to power on. For GET: empty
operationType	GET to read current state, SET to change state

Returns

Frame containing:

- Success: Current power state (0/1) or
- Error: Error reason

Note

KBST;0;GET;7;1;;TSBK

Return current GPS module power state: ON/OFF

KBST;0;SET;7;1;POWER;TSBK

POWER - 0 - OFF, 1 - ON

Command Command ID: 7.1

Definition at line 26 of file gps_commands.cpp.

Here is the call graph for this function:

6.5.2.2 handle_enable_gps_uart_passthrough()

```
Frame handle_enable_gps_uart_passthrough (
            const std::string & param,
            OperationType operationType)
```

Handler for enabling GPS transparent mode (UART pass-through)

Parameters

param	TIMEOUT in seconds (optional, defaults to 60)
operationType	SET

Returns

Frame containing:

- Success: Exit message + reason or
- Error: Error reason

Note

KBST;0;SET;7;2;TIMEOUT;TSBK

TIMEOUT - 1-600s, default 60s

Enters a pass-through mode where UART communication is bridged directly to GPS

Send "##EXIT##" to exit mode before TIMEOUT

Command Command ID: 7.2

Definition at line 74 of file gps_commands.cpp.

Here is the call graph for this function:

6.5.2.3 handle_get_rmc_data()

```
Frame handle_get_rmc_data (
            const std::string & param,
            OperationType operationType)
```

Handler for retrieving GPS RMC (Recommended Minimum Navigation) data.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: Comma-separated RMC tokens or
- Error: Error message

Note

KBST;0;GET;7;3;;TSBK

Command Command ID: 7.3

Definition at line 170 of file gps_commands.cpp.

Here is the call graph for this function:

6.5.2.4 handle_get_gga_data()

```
Frame handle_get_gga_data (
            const std::string & param,
            OperationType operationType)
```

Handler for retrieving GPS GGA (Global Positioning System Fix Data) data.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: Comma-separated GGA tokens or
- Error: Error message

Note

KBST;0;GET;7;4;;TSBK

Command Command ID: 7.4

Definition at line 209 of file gps_commands.cpp.

Here is the call graph for this function:

6.6 Power Commands

Commands for monitoring power subsystem and battery management.

Functions

- Frame handle_get_power_manager_ids (const std::string &param, OperationType operationType)

  Handler for retrieving Power Manager IDs.
- Frame handle_get_voltage_battery (const std::string &param, OperationType operationType)

  Handler for getting battery voltage.
- Frame handle_get_voltage_5v (const std::string &param, OperationType operationType)

  Handler for getting 5V rail voltage.
- Frame handle_get_current_charge_usb (const std::string &param, OperationType operationType)

  Handler for getting USB charge current.
- Frame handle_get_current_charge_solar (const std::string &param, OperationType operationType)

  Handler for getting solar panel charge current.
- Frame handle_get_current_charge_total (const std::string &param, OperationType operationType)

  Handler for getting total charge current.
- Frame handle_get_current_draw (const std::string &param, OperationType operationType)

  Handler for getting system current draw.

6.6.1 Detailed Description

Commands for monitoring power subsystem and battery management.

6.6.2 Function Documentation

6.6.2.1 handle_get_power_manager_ids()

```
Frame handle_get_power_manager_ids (
            const std::string & param,
            OperationType operationType)
```

Handler for retrieving Power Manager IDs.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: String of Power Manager IDs
- Error: Error message

Note

KBST;0;GET;2;0;;TSBK

This command is used to retrieve the IDs of the Power Manager

Command Command ID: 2.0

Definition at line 22 of file power_commands.cpp.

Here is the call graph for this function:

6.6.2.2 handle_get_voltage_battery()

```
Frame handle_get_voltage_battery (
            const std::string & param,
            OperationType operationType)
```

Handler for getting battery voltage.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: Battery voltage in Volts
- Error: Error message

Note

KBST;0;GET;2;2;;TSBK

This command is used to retrieve the battery voltage

Command Command ID: 2.2

Definition at line 49 of file power_commands.cpp.

Here is the call graph for this function:

6.6.2.3 handle_get_voltage_5v()

```
Frame handle_get_voltage_5v (
            const std::string & param,
            OperationType operationType)
```

Handler for getting 5V rail voltage.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: 5V rail voltage in Volts
- Error: Error message

Note

KBST;0;GET;2;3;;TSBK

This command is used to retrieve the 5V rail voltage

Command Command ID: 2.3

Definition at line 76 of file power_commands.cpp.

Here is the call graph for this function:

6.6.2.4 handle_get_current_charge_usb()

```
Frame handle_get_current_charge_usb (
            const std::string & param,
            OperationType operationType)
```

Handler for getting USB charge current.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: USB charge current in milliamps
- Error: Error message

Note

KBST;0;GET;2;4;;TSBK

This command is used to retrieve the USB charge current

Command Command ID: 2.4

Definition at line 103 of file power_commands.cpp.

Here is the call graph for this function:

6.6.2.5 handle_get_current_charge_solar()

```
Frame handle_get_current_charge_solar (
            const std::string & param,
            OperationType operationType)
```

Handler for getting solar panel charge current.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: Solar charge current in milliamps
- Error: Error message

Note

KBST;0;GET;2;5;;TSBK

This command is used to retrieve the solar panel charge current

Command Command ID: 2.5

Definition at line 130 of file power_commands.cpp.

Here is the call graph for this function:

6.6.2.6 handle_get_current_charge_total()

```
Frame handle_get_current_charge_total (
            const std::string & param,
            OperationType operationType)
```

Handler for getting total charge current.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: Total charge current (USB + Solar) in milliamps
- Error: Error message

Note

KBST;0;GET;2;6;;TSBK

This command is used to retrieve the total charge current

Command Command ID: 2.6

Definition at line 157 of file power_commands.cpp.

Here is the call graph for this function:

6.6.2.7 handle_get_current_draw()

```
Frame handle_get_current_draw (
            const std::string & param,
            OperationType operationType)
```

Handler for getting system current draw.

Parameters

param	Empty string expected
operationType	GET

Returns

Frame containing:

- Success: System current consumption in milliamps
- Error: Error message

Note

KBST;0;GET;2;7;;TSBK

This command is used to retrieve the system current draw

Command Command ID: 2.7

Definition at line 184 of file power_commands.cpp.

Here is the call graph for this function:

6.7 Storage Commands

Commands for interacting with the SD card storage.

Functions

- Frame handle_file_download (const std::string &param, OperationType operationType)

  Handles the file download command.
- Frame handle_list_files (const std::string &param, OperationType operationType)

  Handles the list files command.

6.7.1 Detailed Description

Commands for interacting with the SD card storage.

6.7.2 Function Documentation

6.7.2.1 handle_file_download()

```
Frame handle_file_download (
            const std::string & param,
            OperationType operationType)
```

Handles the file download command.

This function reads a file from the SD card and sends it to the ground station in blocks over LoRa. The ground station must acknowledge each block before the next block is sent. A checksum is calculated and sent at the end of the transmission to verify data integrity.

Parameters

param	The filename to download.
operationType	The operation type (must be GET).

Returns

A Frame indicating the result of the operation.

- Success: Frame with "File download complete" message.
- Error: Frame with error message (e.g., "File not found", "ACK timeout").

Note

KBST;0;GET;6;1;[filename];TSBK

Example: **KBST;0;GET;6;1;test.txt;TSBK** - Downloads the file "test.txt".

Command Command ID: 6.1

Definition at line 43 of file storage_commands.cpp.

Here is the call graph for this function:

6.7.2.2 handle_list_files()

```
Frame handle_list_files (
            const std::string & param,
            OperationType operationType)
```

Handles the list files command.

This function lists the files in the root directory of the SD card and sends the filename and size of each file to the ground station in separate frames.

Parameters

param	Unused.
operationType	The operation type (must be GET).

Returns

A Frame indicating the result of the operation.

- Success: Frame with "File listing complete" message.
- Error: Frame with error message (e.g., "Could not open directory").

Note

KBST;0;GET;6;0;;TSBK

This command lists the files and their sizes in the root directory of the SD card.

Command Command ID: 6.0

Definition at line 120 of file storage_commands.cpp.

Here is the call graph for this function:

6.8 INA3221 Power Monitor

Collaboration diagram for INA3221 Power Monitor:

Topics

- Configuration Functions
- Measurement Functions
- Alert Functions

6.8.1 Detailed Description

6.8.2 Configuration Functions

Collaboration diagram for Configuration Functions:

Functions

- INA3221::INA3221 (ina3221_addr_t addr, i2c_inst_t *i2c)

  Constructor for INA3221 class.
- bool INA3221::begin ()

  Initialize the INA3221 device.
- void INA3221::reset ()

  Reset the INA3221 to default settings.
- uint16_t INA3221::get_manufacturer_id ()

  Get the manufacturer ID of the device.
- uint16_t INA3221::get_die_id ()

  Get the die ID of the device.
- uint16_t INA3221::read_register (ina3221_reg_t reg)

  Read a register from the device.
- void INA3221::set_mode_power_down ()

  Set device to power-down mode.
- void INA3221::set_mode_continuous ()

  Set device to continuous measurement mode.
- void INA3221::set_mode_triggered ()

  Set device to triggered measurement mode.
- void INA3221::set_shunt_measurement_enable ()

  Enable shunt voltage measurements.
- void INA3221::set_shunt_measurement_disable ()

  Disable shunt voltage measurements.
- void INA3221::set_bus_measurement_enable ()

  Enable bus voltage measurements.
- void INA3221::set_bus_measurement_disable ()

  Disable bus voltage measurements.
- void INA3221::set_averaging_mode (ina3221_avg_mode_t mode)

  Set the averaging mode for measurements.
- void INA3221::set_bus_conversion_time (ina3221_conv_time_t convTime)

  Set bus voltage conversion time.
- void INA3221::set_shunt_conversion_time (ina3221_conv_time_t convTime)

  Set shunt voltage conversion time.

6.8.2.1 Detailed Description

Functions for configuring the INA3221 device

6.8.2.2 Function Documentation

6.8.2.2.1 INA3221()

```
INA3221::INA3221 (
            ina3221_addr_t addr,
            i2c_inst_t * i2c)
```

Constructor for INA3221 class.

Parameters

addr	I2C address of the device
i2c	Pointer to I2C instance

Definition at line 46 of file INA3221.cpp.

6.8.2.2.2 begin()

```
bool INA3221::begin ()
```

Initialize the INA3221 device.

Returns

true if initialization successful, false otherwise

Sets up shunt resistors, filter resistors, and verifies device IDs

Definition at line 56 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.3 reset()

```
void INA3221::reset ()
```

Reset the INA3221 to default settings.

Performs a software reset of the device by setting the reset bit

Definition at line 90 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.4 get_manufacturer_id()

```
uint16_t INA3221::get_manufacturer_id ()
```

Get the manufacturer ID of the device.

Returns

16-bit manufacturer ID (should be 0x5449)

Definition at line 104 of file INA3221.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

6.8.2.2.5 get_die_id()

```
uint16_t INA3221::get_die_id ()
```

Get the die ID of the device.

Returns

16-bit die ID (should be 0x3220)

Definition at line 116 of file INA3221.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

6.8.2.2.6 read_register()

```
uint16_t INA3221::read_register (
            ina3221_reg_t reg)
```

Read a register from the device.

Parameters

reg	Register address to read

Returns

16-bit value read from the register

Definition at line 129 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.7 set_mode_power_down()

```
void INA3221::set_mode_power_down ()
```

Set device to power-down mode.

Disables bus voltage and continuous measurements

Definition at line 143 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.8 set_mode_continuous()

```
void INA3221::set_mode_continuous ()
```

Set device to continuous measurement mode.

Enables continuous measurement of bus voltage and shunt voltage

Definition at line 158 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.9 set_mode_triggered()

```
void INA3221::set_mode_triggered ()
```

Set device to triggered measurement mode.

Disables continuous measurements, requiring manual triggers

Definition at line 172 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.10 set_shunt_measurement_enable()

```
void INA3221::set_shunt_measurement_enable ()
```

Enable shunt voltage measurements.

Definition at line 185 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.11 set_shunt_measurement_disable()

```
void INA3221::set_shunt_measurement_disable ()
```

Disable shunt voltage measurements.

Definition at line 198 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.12 set_bus_measurement_enable()

```
void INA3221::set_bus_measurement_enable ()
```

Enable bus voltage measurements.

Definition at line 211 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.13 set_bus_measurement_disable()

```
void INA3221::set_bus_measurement_disable ()
```

Disable bus voltage measurements.

Definition at line 224 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.14 set_averaging_mode()

```
void INA3221::set_averaging_mode (
            ina3221_avg_mode_t mode)
```

Set the averaging mode for measurements.

Parameters

mode	Number of samples to average

Definition at line 238 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.15 set_bus_conversion_time()

```
void INA3221::set_bus_conversion_time (
            ina3221_conv_time_t convTime)
```

Set bus voltage conversion time.

Parameters

convTime	Conversion time setting

Definition at line 252 of file INA3221.cpp.

Here is the call graph for this function:

6.8.2.2.16 set_shunt_conversion_time()

```
void INA3221::set_shunt_conversion_time (
            ina3221_conv_time_t convTime)
```

Set shunt voltage conversion time.

Parameters

convTime	Conversion time setting

Definition at line 266 of file INA3221.cpp.

Here is the call graph for this function:

6.8.3 Measurement Functions

Collaboration diagram for Measurement Functions:

Functions

- int32_t INA3221::get_shunt_voltage (ina3221_ch_t channel)

  Get shunt voltage for a specific channel.
- float INA3221::get_current_ma (ina3221_ch_t channel)

  Get current for a specific channel.
- float INA3221::get_voltage (ina3221_ch_t channel)

  Get bus voltage for a specific channel.

6.8.3.1 Detailed Description

Functions for reading voltage, current and power measurements

6.8.3.2 Function Documentation

6.8.3.2.1 get_shunt_voltage()

```
int32_t INA3221::get_shunt_voltage (
            ina3221_ch_t channel)
```

Get shunt voltage for a specific channel.

Parameters

channel	Channel number (1-3)

Returns

Shunt voltage in microvolts (µV)

Definition at line 282 of file INA3221.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

6.8.3.2.2 get_current_ma()

```
float INA3221::get_current_ma (
            ina3221_ch_t channel)
```

Get current for a specific channel.

Parameters

channel	Channel number (1-3)

Returns

Current in milliamps (mA)

Definition at line 314 of file INA3221.cpp.

Here is the call graph for this function:

6.8.3.2.3 get_voltage()

```
float INA3221::get_voltage (
            ina3221_ch_t channel)
```

Get bus voltage for a specific channel.

Parameters

channel	Channel number (1-3)

Returns

Voltage in volts (V)

Definition at line 330 of file INA3221.cpp.

Here is the call graph for this function:

6.8.4 Alert Functions

Collaboration diagram for Alert Functions:

Functions

- void INA3221::set_warn_alert_limit (ina3221_ch_t channel, float voltage_v)

  Set warning alert voltage threshold for a channel.
- void INA3221::set_crit_alert_limit (ina3221_ch_t channel, float voltage_v)

  Set critical alert voltage threshold for a channel.
- void INA3221::set_power_valid_limit (float voltage_upper_v, float voltage_lower_v)

  Set power valid voltage range.
- void INA3221::enable_alerts ()

  Enable all alert functions.
- bool INA3221::get_warn_alert (ina3221_ch_t channel)

  Get warning alert status for a channel.
- bool INA3221::get_crit_alert (ina3221_ch_t channel)

  Get critical alert status for a channel.
- bool INA3221::get_power_valid_alert ()

  Get power valid alert status.
- void INA3221::set_alert_latch (bool enable)

  Set alert latch mode.

6.8.4.1 Detailed Description

Functions for configuring and reading alert conditions

6.8.4.2 Function Documentation

6.8.4.2.1 set_warn_alert_limit()

```
void INA3221::set_warn_alert_limit (
            ina3221_ch_t channel,
            float voltage_v)
```

Set warning alert voltage threshold for a channel.

Parameters

channel	Channel number (1-3)
voltage↩ _v	Voltage threshold in volts

Definition at line 360 of file INA3221.cpp.

Here is the call graph for this function:

6.8.4.2.2 set_crit_alert_limit()

```
void INA3221::set_crit_alert_limit (
            ina3221_ch_t channel,
            float voltage_v)
```

Set critical alert voltage threshold for a channel.

Parameters

channel	Channel number (1-3)
voltage_v	Voltage threshold in volts

Definition at line 385 of file INA3221.cpp.

Here is the call graph for this function:

6.8.4.2.3 set_power_valid_limit()

```
void INA3221::set_power_valid_limit (
            float voltage_upper_v,
            float voltage_lower_v)
```

Set power valid voltage range.

Parameters

voltage_upper_v	Upper voltage threshold in volts
voltage_lower_v	Lower voltage threshold in volts

Definition at line 410 of file INA3221.cpp.

Here is the call graph for this function:

6.8.4.2.4 enable_alerts()

```
void INA3221::enable_alerts ()
```

Enable all alert functions.

Enables warning alerts, critical alerts, and power valid alerts for all channels

Definition at line 426 of file INA3221.cpp.

Here is the call graph for this function:

6.8.4.2.5 get_warn_alert()

```
bool INA3221::get_warn_alert (
            ina3221_ch_t channel)
```

Get warning alert status for a channel.

Parameters

channel	Channel number (1-3)

Returns

true if warning alert is active, false otherwise

Definition at line 448 of file INA3221.cpp.

Here is the call graph for this function:

6.8.4.2.6 get_crit_alert()

```
bool INA3221::get_crit_alert (
            ina3221_ch_t channel)
```

Get critical alert status for a channel.

Parameters

channel	Channel number (1-3)

Returns

true if critical alert is active, false otherwise

Definition at line 467 of file INA3221.cpp.

Here is the call graph for this function:

6.8.4.2.7 get_power_valid_alert()

```
bool INA3221::get_power_valid_alert ()
```

Get power valid alert status.

Returns

true if power valid alert is active, false otherwise

Definition at line 485 of file INA3221.cpp.

Here is the call graph for this function:

6.8.4.2.8 set_alert_latch()

```
void INA3221::set_alert_latch (
            bool enable)
```

Set alert latch mode.

Parameters

enable	true to enable alert latching, false for transparent alerts

Definition at line 497 of file INA3221.cpp.

Here is the call graph for this function:

Chapter 7

Class Documentation

7.1 BH1750 Class Reference

```
#include <BH1750.h>
```

Public Types

- enum class Mode : uint8_t {
  UNCONFIGURED_POWER_DOWN = 0x00 , POWER_ON = 0x01 , RESET = 0x07 , CONTINUOUS_HIGH_RES_MODE = 0x10 ,

7.2.1 Detailed Description

Definition at line 9 of file BH1750_WRAPPER.h.

7.2.2 Constructor & Destructor Documentation

7.2.2.1 BH1750Wrapper()

```
BH1750Wrapper::BH1750Wrapper ()
```

Definition at line 6 of file BH1750_WRAPPER.cpp.

7.2.3 Member Function Documentation

7.2.3.1 get_i2c_addr()

```
int BH1750Wrapper::get_i2c_addr ()
```

7.2.3.2 init()

```
bool BH1750Wrapper::init ()  [override], [virtual]
```

Implements ISensor.

Definition at line 10 of file BH1750_WRAPPER.cpp.

7.2.3.3 read_data()

```
float BH1750Wrapper::read_data (
            SensorDataTypeIdentifier type)  [override], [virtual]
```

Implements ISensor.

Definition at line 15 of file BH1750_WRAPPER.cpp.

7.2.3.4 is_initialized()

```
bool BH1750Wrapper::is_initialized () const  [override], [virtual]
```

Implements ISensor.

Definition at line 22 of file BH1750_WRAPPER.cpp.

7.2.3.5 get_type()

```
SensorType BH1750Wrapper::get_type () const  [override], [virtual]
```

Implements ISensor.

Definition at line 26 of file BH1750_WRAPPER.cpp.

7.2.3.6 configure()

```
bool BH1750Wrapper::configure (
            const std::map< std::string, std::string > & config)  [virtual]
```

Implements ISensor.

Definition at line 30 of file BH1750_WRAPPER.cpp.

7.7.3.7 i2c_read_reg()

```
int DS3231::i2c_read_reg (
            uint8_t reg_addr,
            size_t length,
            uint8_t * data)  [private]
```

Library function to read a specific I2C register address.

Parameters

in	*reg_addr*	Register address to be read.
in	*length*	length of the data in bytes to be read.
out	*data*	Buffer to store the read data.

Returns

0 if successful, -1 if i2c failure.

Definition at line 136 of file DS3231.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.7.3.8 i2c_write_reg()

```
int DS3231::i2c_write_reg (
            uint8_t reg_addr,
            size_t length,
            uint8_t * data)  [private]
```

Library function to write to a specific I2C register address.

Parameters

in	*reg_addr*	Register address to be written.
in	*length*	Length of the data to be written in bytes.
in	*data*	Pointer to the data buffer.

Returns

0 if successful, -1 if i2c failure.

Definition at line 171 of file DS3231.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.7.3.9 bin_to_bcd()

```
uint8_t DS3231::bin_to_bcd (
            const uint8_t data)  [private]
```

Library function that takes an 8-bit unsigned integer and converts it into a Binary Coded Decimal number that can be written to DS3231 registers.

Parameters

in	*data*	Number to be converted.

Returns

Number in BCD form.

Definition at line 199 of file DS3231.cpp.

Here is the caller graph for this function:

7.7.3.10 bcd_to_bin()

```
uint8_t DS3231::bcd_to_bin (
            const uint8_t bcd)  [private]
```

Library function that takes a BCD number and converts it to an unsigned 8-bit integer.

Parameters

in	*bcd*	BCD number to be converted.

Returns

Unsigned 8-bit integer.

Definition at line 211 of file DS3231.cpp.

Here is the caller graph for this function:

7.9 ErriezDS3231 Class Reference

DS3231 RTC class.

```
#include <ErriezDS3231.h>
```

Public Member Functions

- bool begin ()

  Initialize and detect DS3231 RTC.
- bool isRunning ()

  Read RTC OSF (Oscillator Stop Flag) from status register.
- bool clockEnable (bool enable=true)

  Enable or disable oscillator when running on V-BAT.
- time_t getEpoch ()

  Read Unix UTC epoch time_t.
- bool setEpoch (time_t t)

  Write Unix epoch UTC time to RTC.
- bool read (struct tm *dt)

  Read date and time from RTC.
- bool write (const struct tm *dt)

  Write date and time to RTC.
- bool setTime (uint8_t hour, uint8_t min, uint8_t sec)

  Write time to RTC.
- bool getTime (uint8_t *hour, uint8_t *min, uint8_t *sec)

  Read time from RTC.
- bool setDateTime (uint8_t hour, uint8_t min, uint8_t sec, uint8_t mday, uint8_t mon, uint16_t year, uint8_t wday)

  Set date time.
- bool getDateTime (uint8_t *hour, uint8_t *min, uint8_t *sec, uint8_t *mday, uint8_t *mon, uint16_t *year, uint8_t *wday)

  Get date time.
- bool setAlarm1 (Alarm1Type alarmType, uint8_t dayDate, uint8_t hours, uint8_t minutes, uint8_t seconds)
- bool setAlarm2 (Alarm2Type alarmType, uint8_t dayDate, uint8_t hours, uint8_t minutes)
- bool alarmInterruptEnable (AlarmId alarmId, bool enable)
- bool getAlarmFlag (AlarmId alarmId)
- bool clearAlarmFlag (AlarmId alarmId)
- bool setSquareWave (SquareWave squareWave)
- bool outputClockPinEnable (bool enable)
- bool setAgingOffset (int8_t val)

- int8_t getAgingOffset ()
- bool startTemperatureConversion ()
- bool getTemperature (int8_t *temperature, uint8_t *fraction)

  Read temperature.
- uint8_t bcdToDec (uint8_t bcd)

  BCD to decimal conversion.
- uint8_t decToBcd (uint8_t dec)

  Decimal to BCD conversion.
- uint8_t readRegister (uint8_t reg)

  Read register.
- bool writeRegister (uint8_t reg, uint8_t value)

  Write register.
- bool readBuffer (uint8_t reg, void *buffer, uint8_t len)

  Read buffer from RTC.
- bool writeBuffer (uint8_t reg, void *buffer, uint8_t len)

  Write buffer to RTC.

7.9.1 Detailed Description

DS3231 RTC class.

Definition at line 149 of file ErriezDS3231.h.

7.9.2 Member Function Documentation

7.9.2.1 begin()

```
bool ErriezDS3231::begin ()
```

Initialize and detect DS3231 RTC.

Call this function from setup().

Return values

true	RTC detected.
false	RTC not detected.

Definition at line 52 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.2 isRunning()

```
bool ErriezDS3231::isRunning ()
```

Read RTC OSF (Oscillator Stop Flag) from status register.

The application is responsible for checking the Oscillator Stop Flag (OSF) before reading date/time date. This function may be used to judge the validity of the date/time registers.

Return values

true	RTC clock is running.
false	RTC oscillator was stopped: The date/time data is invalid. The application should synchronize and program a new date/time.

Definition at line 110 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.3 clockEnable()

```
bool ErriezDS3231::clockEnable (
            bool enable = true)
```

Enable or disable oscillator when running on V-BAT.

Parameters

enable	true: Enable RTC clock when running on V-BAT. false: Stop RTC clock when running on V-BAT. Oscillator Stop Flag (OSF) bit will be set in status register which can be read on next power-on.

Return values

true	Success.
false	Oscillator enable failed.

Definition at line 74 of file ErriezDS3231.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.9.2.4 getEpoch()

```
time_t ErriezDS3231::getEpoch ()
```

Read Unix UTC epoch time_t.

Returns

Unix epoch time_t seconds since 1970.

Definition at line 127 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.5 setEpoch()

```
bool ErriezDS3231::setEpoch (
            time_t t)
```

Write Unix epoch UTC time to RTC.

Parameters

t	time_t time

Return values

true	Success.
false	Set epoch failed.

Definition at line 159 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.6 read()

```
bool ErriezDS3231::read (
            struct tm * dt)
```

Read date and time from RTC.

Read all RTC registers at once to prevent a time/date register change in the middle of the register read operation.

Parameters

dt	Date and time struct tm.

Return values

true	Success
false	Read failed.

Definition at line 187 of file ErriezDS3231.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.9.2.7 write()

```
bool ErriezDS3231::write (
            const struct tm * dt)
```

Write date and time to RTC.

Write all RTC registers at once to prevent a time/date register change in the middle of the register write operation. This function enables the oscillator and clear the Oscillator Stop Flag (OSF) in the status register.

Parameters

dt	Date/time struct tm. Providing invalid date/time data may result in unpredictable behavior.

Return values

true	Success.
false	Write failed.

Definition at line 243 of file ErriezDS3231.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.9.2.8 setTime()

```
bool ErriezDS3231::setTime (
            uint8_t hour,
            uint8_t min,
            uint8_t sec)
```

Write time to RTC.

Write hour, minute and second registers to RTC.

Parameters

hour	Hours 0..23.
min	Minutes 0..59.
sec	Seconds 0..59.

Return values

true	Success.
false	Set time failed.

Definition at line 280 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.9 getTime()

```
bool ErriezDS3231::getTime (
            uint8_t * hour,
            uint8_t * min,
            uint8_t * sec)
```

Read time from RTC.

Read hour, minute and second registers from RTC.

Parameters

hour	Hours 0..23.
min	Minutes 0..59.
sec	Seconds 0..59.

Return values

true	Success.
false	Invalid second, minute or hour read from RTC. The time is set to zero.

Definition at line 306 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.10 setDateTime()

```
bool ErriezDS3231::setDateTime (
            uint8_t hour,
            uint8_t min,
            uint8_t sec,
            uint8_t mday,
            uint8_t mon,
            uint16_t year,
            uint8_t wday)
```

Set date time.

Parameters

hour	Hours 0..23
min	Minutes 0..59
sec	Seconds 0..59
mday	Day of the month 1..31
mon	Month 1..12 (1=January)
year	Year 2000..2099
wday	Day of the week 0..6 (0=Sunday, .. 6=Saturday)

Return values

true	Success.
false	Set date/time failed.

Definition at line 354 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.11 getDateTime()

```
bool ErriezDS3231::getDateTime (
            uint8_t * hour,
            uint8_t * min,
            uint8_t * sec,
            uint8_t * mday,
            uint8_t * mon,
            uint16_t * year,
            uint8_t * wday)
```

Get date time.

Parameters

hour	Hours 0..23
min	Minutes 0..59
sec	Seconds 0..59
mday	Day of the month 1..31
mon	Month 1..12 (1=January)
year	Year 2000..2099
wday	Day of the week 0..6 (0=Sunday, .. 6=Saturday)

Return values

true	Success.
false	Get date/time failed.

Definition at line 394 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.12 setAlarm1()

```
bool ErriezDS3231::setAlarm1 (
            Alarm1Type alarmType,
            uint8_t dayDate,
            uint8_t hours,
            uint8_t minutes,
            uint8_t seconds)
```

7.9.2.13 setAlarm2()

```
bool ErriezDS3231::setAlarm2 (
            Alarm2Type alarmType,
            uint8_t dayDate,
            uint8_t hours,
            uint8_t minutes)
```

7.9.2.14 alarmInterruptEnable()

```
bool ErriezDS3231::alarmInterruptEnable (
            AlarmId alarmId,
            bool enable)
```

7.9.2.15 getAlarmFlag()

```
bool ErriezDS3231::getAlarmFlag (
            AlarmId alarmId)
```

7.9.2.16 clearAlarmFlag()

```
bool ErriezDS3231::clearAlarmFlag (
            AlarmId alarmId)
```

7.9.2.17 setSquareWave()

```
bool ErriezDS3231::setSquareWave (
            SquareWave squareWave)
```

7.9.2.18 outputClockPinEnable()

```
bool ErriezDS3231::outputClockPinEnable (
            bool enable)
```

7.9.2.19 setAgingOffset()

```
bool ErriezDS3231::setAgingOffset (
            int8_t val)
```

7.9.2.20 getAgingOffset()

```
int8_t ErriezDS3231::getAgingOffset ()
```

7.9.2.21 startTemperatureConversion()

```
bool ErriezDS3231::startTemperatureConversion ()
```

7.9.2.22 getTemperature()

```
bool ErriezDS3231::getTemperature (
            int8_t * temperature,
            uint8_t * fraction)
```

Read temperature.

Parameters

temperature	8-bit signed temperature in degree Celsius.
fraction	Temperature fraction in steps of 0.25 degree Celsius. The returned value is a decimal value to prevent floating point usage. The application should divided the fraction by 100.

Return values

true	Success
false	Set get temperature failed.

Definition at line 430 of file ErriezDS3231.cpp.

Here is the call graph for this function:

7.9.2.23 bcdToDec()

```
uint8_t ErriezDS3231::bcdToDec (
            uint8_t bcd)
```

BCD to decimal conversion.

Parameters

bcd	BCD encoded value.

Returns

Decimal value.

Definition at line 460 of file ErriezDS3231.cpp.

Here is the caller graph for this function:

7.9.2.24 decToBcd()

```
uint8_t ErriezDS3231::decToBcd (
            uint8_t dec)
```

Decimal to BCD conversion.

Parameters

dec	Decimal value.

Returns

BCD encoded value.

Definition at line 472 of file ErriezDS3231.cpp.

Here is the caller graph for this function:

7.9.2.25 readRegister()

```
uint8_t ErriezDS3231::readRegister (
            uint8_t reg)
```

Read register.

Please refer to the RTC datasheet.

Parameters

reg	RTC register number 0x00..0x12.

Returns

value 8-bit unsigned register value.

Definition at line 486 of file ErriezDS3231.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.9.2.26 writeRegister()

```
bool ErriezDS3231::writeRegister (
            uint8_t reg,
            uint8_t value)
```

Write register.

Please refer to the RTC datasheet.

Parameters

reg	RTC register number 0x00..0x12.
value	8-bit unsigned register value.

Return values

true	Success
false	Write register failed

Definition at line 509 of file ErriezDS3231.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.9.2.27 readBuffer()

```
bool ErriezDS3231::readBuffer (
            uint8_t reg,
            void * buffer,
            uint8_t readLen)
```

Read buffer from RTC.

Parameters

reg	RTC register number 0x00..0x12.
buffer	Buffer.
readLen	Buffer length. Reading is only allowed within valid RTC registers.

Return values

true	Success
false	I2C read failed.

Definition at line 558 of file ErriezDS3231.cpp.

Here is the caller graph for this function:

7.9.2.28 writeBuffer()

```
bool ErriezDS3231::writeBuffer (
            uint8_t reg,
            void * buffer,
            uint8_t writeLen)
```

Write buffer to RTC.

Please refer to the RTC datasheet.

Parameters

reg	RTC register number 0x00..0x12.
buffer	Buffer.
writeLen	Buffer length. Writing is only allowed within valid RTC registers.

Return values

true	Success
false	I2C write failed.

Definition at line 530 of file ErriezDS3231.cpp.

7.10 EventEmitter Class Reference

Provides a static method for emitting events.

```
#include <event_manager.h>
```

Static Public Member Functions

- template<typename T>
  static void emit (EventGroup group, T event)

  Emits an event.

7.10.1 Detailed Description

Provides a static method for emitting events.

Definition at line 214 of file event_manager.h.

7.10.2 Member Function Documentation

7.10.2.1 emit()

```
template<typename T>
static void EventEmitter::emit (
            EventGroup group,
            T event)  [inline], [static]
```

Emits an event.

Parameters

group	The event group.
event	The event identifier.

Template Parameters

T	The type of the event identifier.

Definition at line 223 of file event_manager.h.

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

- lib/eventman/event_manager.h

7.11 EventLog Class Reference

Represents a single event log entry.

```
#include <event_manager.h>
```

Public Member Functions

- std::string to_string () const

  Converts the EventLog to a string representation.

Public Attributes

- uint16_t id

  Sequence number.
- uint32_t timestamp

  Unix timestamp or system time.
- uint8_t group

  Event group identifier.
- uint8_t event

  Specific event identifier.

7.11.1 Detailed Description

Represents a single event log entry.

Definition at line 73 of file event_manager.h.

7.11.2 Member Function Documentation

7.11.2.1 to_string()

```
std::string EventLog::to_string () const  [inline]
```

Converts the EventLog to a string representation.

Returns

A string representation of the EventLog.

Definition at line 84 of file event_manager.h.

Here is the caller graph for this function:

7.11.3 Member Data Documentation

7.11.3.1 id

```
uint16_t EventLog::id
```

Sequence number.

Definition at line 75 of file event_manager.h.

7.11.3.2 timestamp

```
uint32_t EventLog::timestamp
```

Unix timestamp or system time.

Definition at line 76 of file event_manager.h.

7.11.3.3 group

```
uint8_t EventLog::group
```

Event group identifier.

Definition at line 77 of file event_manager.h.

7.11.3.4 event

```
uint8_t EventLog::event
```

Specific event identifier.

Definition at line 78 of file event_manager.h.

The documentation for this class was generated from the following file:

- lib/eventman/event_manager.h

7.12 EventManager Class Reference

Manages the event logging system.

```
#include <event_manager.h>
```

Inheritance diagram for EventManager:

Collaboration diagram for EventManager:

Public Member Functions

- EventManager ()

  Constructor for the EventManager.
- virtual ~EventManager ()=default

  Virtual destructor for the EventManager.
- virtual void init ()

  Initializes the EventManager.
- void log_event (uint8_t group, uint8_t event)

  Logs an event.
- const EventLog & get_event (size_t index) const

  Retrieves an event from the event buffer.
- size_t get_event_count () const

  Gets the number of events in the buffer.
- virtual bool save_to_storage ()=0

  Saves the events to storage.
- virtual bool load_from_storage ()=0

  Loads the events from storage.

Protected Attributes

- EventLog events [EVENT_BUFFER_SIZE]

  Event buffer.
- size_t eventCount

  Number of events in the buffer.
- size_t writeIndex

  Index of the next event to be written.
- mutex_t eventMutex

  Mutex for protecting the event buffer.
- volatile uint16_t nextEventId

  Next event ID.
- bool needsPersistence

  Flag indicating whether the events need to be saved to storage.

7.12.1 Detailed Description

Manages the event logging system.

Definition at line 98 of file event_manager.h.

7.12.2 Constructor & Destructor Documentation

7.12.2.1 EventManager()

```
EventManager::EventManager () [inline]
```

Constructor for the EventManager.

Initializes the event buffer, mutex, and other internal variables.

Definition at line 104 of file event_manager.h.

7.12.2.2 ~EventManager()

```
virtual EventManager::~EventManager () [virtual], [default]
```

Virtual destructor for the EventManager.

7.12.3 Member Function Documentation

7.12.3.1 init()

```
virtual void EventManager::init () [inline], [virtual]
```

Initializes the EventManager.

Loads events from storage.

Definition at line 122 of file event_manager.h.

Here is the call graph for this function:

Here is the caller graph for this function:

7.12.3.2 log_event()

```
void EventManager::log_event (
            uint8_t group,
            uint8_t event)
```

Logs an event.

Logs an event to the event buffer.

Parameters

group	The event group.
event	The event identifier.
group	The event group.
event	The event ID.

Logs the event with a timestamp, group, and event ID. Prints the event to the UART, and saves the event to storage if the buffer is full or if it's a power-related event.

Definition at line 80 of file event_manager.cpp.

Here is the call graph for this function:

7.12.3.3 get_event()

```
const EventLog & EventManager::get_event (
            size_t index) const
```

Retrieves an event from the event buffer.

Parameters

index	The index of the event to retrieve.

Returns

A const reference to the EventLog at the specified index.

Parameters

index	The index of the event to retrieve.

Returns

A const reference to the EventLog at the specified index. Returns an empty event if the index is out of bounds.

Definition at line 114 of file event_manager.cpp.

7.12.3.4 get_event_count()

```
size_t EventManager::get_event_count () const [inline]
```

Gets the number of events in the buffer.

Returns

The number of events in the buffer.

Definition at line 144 of file event_manager.h.

7.12.3.5 save_to_storage()

```
virtual bool EventManager::save_to_storage () [pure virtual]
```

Saves the events to storage.

Returns

True if the events were successfully saved, false otherwise.

Implemented in EventManagerImpl.

Here is the caller graph for this function:

7.12.3.6 load_from_storage()

```
virtual bool EventManager::load_from_storage ()  [pure virtual]
```

Loads the events from storage.

Returns

True if the events were successfully loaded, false otherwise.

Implemented in EventManagerImpl.

Here is the caller graph for this function:

7.12.4 Member Data Documentation

7.12.4.1 events

```
EventLog EventManager::events[EVENT_BUFFER_SIZE]  [protected]
```

Event buffer.

Definition at line 159 of file event_manager.h.

7.12.4.2 eventCount

```
size_t EventManager::eventCount  [protected]
```

Number of events in the buffer.

Definition at line 160 of file event_manager.h.

7.12.4.3 writeIndex

```
size_t EventManager::writeIndex  [protected]
```

Index of the next event to be written.

Definition at line 161 of file event_manager.h.

7.12.4.4 eventMutex

```
mutex_t EventManager::eventMutex [protected]
```

Mutex for protecting the event buffer.

Definition at line 162 of file event_manager.h.

7.12.4.5 nextEventId

```
volatile uint16_t EventManager::nextEventId [protected]
```

Next event ID.

Definition at line 163 of file event_manager.h.

7.12.4.6 needsPersistence

```
bool EventManager::needsPersistence [protected]
```

Flag indicating whether the events need to be saved to storage.

Definition at line 164 of file event_manager.h.

The documentation for this class was generated from the following files:

- lib/eventman/event_manager.h
- lib/eventman/event_manager.cpp

7.13 EventManagerImpl Class Reference

Implementation of the EventManager class.

```
#include <event_manager.h>
```

Inheritance diagram for EventManagerImpl:

Collaboration diagram for EventManagerImpl:

Public Member Functions

- EventManagerImpl ()

  Constructor for the EventManagerImpl.
- bool save_to_storage () override

  Saves the events to storage.
- bool load_from_storage () override

  Loads the events from storage.

Public Member Functions inherited from EventManager

- EventManager ()

  Constructor for the EventManager.
- virtual ~EventManager ()=default

  Virtual destructor for the EventManager.
- virtual void init ()

  Initializes the EventManager.
- void log_event (uint8_t group, uint8_t event)

  Logs an event.
- const EventLog & get_event (size_t index) const

  Retrieves an event from the event buffer.
- size_t get_event_count () const

  Gets the number of events in the buffer.

Additional Inherited Members

Protected Attributes inherited from EventManager

- EventLog events [EVENT_BUFFER_SIZE]

  Event buffer.
- size_t eventCount

  Number of events in the buffer.
- size_t writeIndex

  Index of the next event to be written.
- mutex_t eventMutex

  Mutex for protecting the event buffer.
- volatile uint16_t nextEventId

  Next event ID.
- bool needsPersistence

  Flag indicating whether the events need to be saved to storage.

7.13.1 Detailed Description

Implementation of the EventManager class.

Definition at line 172 of file event_manager.h.

7.13.2 Constructor & Destructor Documentation

7.13.2.1 EventManagerImpl()

```
EventManagerImpl::EventManagerImpl () [inline]
```

Constructor for the EventManagerImpl.

Initializes the EventManagerImpl and calls the init method.

Definition at line 178 of file event_manager.h.

Here is the call graph for this function:

7.13.3 Member Function Documentation

7.13.3.1 save_to_storage()

```
bool EventManagerImpl::save_to_storage () [inline], [override], [virtual]
```

Saves the events to storage.

Returns

True if the events were successfully saved, false otherwise.

This method is not yet implemented.

Implements EventManager.

Definition at line 187 of file event_manager.h.

7.13.3.2 load_from_storage()

```
bool EventManagerImpl::load_from_storage () [inline], [override], [virtual]
```

Loads the events from storage.

Returns

True if the events were successfully loaded, false otherwise.

This method is not yet implemented.

Implements EventManager.

Definition at line 198 of file event_manager.h.

7.18 INA3221 Class Reference

INA3221 Triple-Channel Power Monitor driver class.

```
#include <INA3221.h>
```

Collaboration diagram for INA3221:

Classes

- struct conf_reg_t

  Configuration register bit fields.
- struct masken_reg_t

  Mask/Enable register bit fields.

Public Member Functions

- INA3221 (ina3221_addr_t addr, i2c_inst_t *i2c)

  Constructor for INA3221 class.
- bool begin ()

  Initialize the INA3221 device.
- uint16_t read_register (ina3221_reg_t reg)

  Read a register from the device.
- void reset ()

  Reset the INA3221 to default settings.
- void set_mode_power_down ()

  Set device to power-down mode.
- void set_mode_continuous ()

  Set device to continuous measurement mode.
- void set_mode_triggered ()

  Set device to triggered measurement mode.
- void set_shunt_measurement_enable ()

  Enable shunt voltage measurements.
- void set_shunt_measurement_disable ()

  Disable shunt voltage measurements.
- void set_bus_measurement_enable ()

  Enable bus voltage measurements.
- void set_bus_measurement_disable ()

  Disable bus voltage measurements.
- void set_averaging_mode (ina3221_avg_mode_t mode)

  Set the averaging mode for measurements.
- void set_bus_conversion_time (ina3221_conv_time_t convTime)

  Set bus voltage conversion time.
- void set_shunt_conversion_time (ina3221_conv_time_t convTime)

  Set shunt voltage conversion time.
- uint16_t get_manufacturer_id ()

  Get the manufacturer ID of the device.
- uint16_t get_die_id ()

  Get the die ID of the device.
- int32_t get_shunt_voltage (ina3221_ch_t channel)

  Get shunt voltage for a specific channel.
- float get_current (ina3221_ch_t channel)
- float get_current_ma (ina3221_ch_t channel)

  Get current for a specific channel.
- float get_voltage (ina3221_ch_t channel)

  Get bus voltage for a specific channel.
- void set_warn_alert_limit (ina3221_ch_t channel, float voltage_v)

  Set warning alert voltage threshold for a channel.

- void set_crit_alert_limit (ina3221_ch_t channel, float voltage_v)

  Set critical alert voltage threshold for a channel.
- void set_power_valid_limit (float voltage_upper_v, float voltage_lower_v)

  Set power valid voltage range.
- void enable_alerts ()

  Enable all alert functions.
- bool get_warn_alert (ina3221_ch_t channel)

  Get warning alert status for a channel.
- bool get_crit_alert (ina3221_ch_t channel)

  Get critical alert status for a channel.
- bool get_power_valid_alert ()

  Get power valid alert status.
- void set_alert_latch (bool enable)

  Set alert latch mode.

Private Member Functions

- void _read (ina3221_reg_t reg, uint16_t *val)

  Read a 16-bit register from the device.
- void _write (ina3221_reg_t reg, uint16_t *val)

  Write a 16-bit value to a register.

Private Attributes

- i2c_inst_t * _i2c
- ina3221_addr_t _i2c_addr
- uint32_t _shuntRes [INA3221_CH_NUM]
- uint32_t _filterRes [INA3221_CH_NUM]
- masken_reg_t _masken_reg

7.18.1 Detailed Description

INA3221 Triple-Channel Power Monitor driver class.

Provides functionality for voltage, current, and power monitoring with configurable alerts and power valid monitoring

Definition at line 96 of file INA3221.h.

7.18.2 Member Function Documentation

7.18.2.1 _read()

```
void INA3221::_read (
            ina3221_reg_t reg,
            uint16_t * val)  [private]
```

Read a 16-bit register from the device.

Parameters

reg	Register address
val	Pointer to store the read value

Definition at line 513 of file INA3221.cpp.

Here is the caller graph for this function:

7.18.2.2 _write()

```
void INA3221::_write (
            ina3221_reg_t reg,
            uint16_t * val)  [private]
```

Write a 16-bit value to a register.

Parameters

reg	Register address
val	Pointer to the value to write

Definition at line 539 of file INA3221.cpp.

Here is the caller graph for this function:

7.18.2.3 get_current()

```
float INA3221::get_current (
            ina3221_ch_t channel)
```

```

7.19.3 Member Function Documentation

7.19.3.1 init()

```
virtual bool ISensor::init () [pure virtual]
```

Implemented in BH1750Wrapper, BME280Wrapper, HMC5883LWrapper, and MPU6050Wrapper.

7.19.3.2 read_data()

```
virtual float ISensor::read_data (
            SensorDataTypeIdentifier type) [pure virtual]
```

Implemented in BH1750Wrapper, BME280Wrapper, HMC5883LWrapper, and MPU6050Wrapper.

7.19.3.3 is_initialized()

```
virtual bool ISensor::is_initialized () const [pure virtual]
```

Implemented in BH1750Wrapper, BME280Wrapper, HMC5883LWrapper, and MPU6050Wrapper.

7.19.3.4 get_type()

```
virtual SensorType ISensor::get_type () const [pure virtual]
```

Implemented in BH1750Wrapper, BME280Wrapper, HMC5883LWrapper, and MPU6050Wrapper.

7.19.3.5 configure()

```
virtual bool ISensor::configure (
            const std::map< std::string, std::string > & config)  [pure virtual]
```

Implemented in BH1750Wrapper, BME280Wrapper, HMC5883LWrapper, and MPU6050Wrapper.

The documentation for this class was generated from the following file:

- lib/sensors/ISensor.h

7.20 LoRaClass Class Reference

```
#include <LoRa-RP2040.h>
```

7.20.1 Detailed Description

Definition at line 17 of file LoRa-RP2040.h.

7.20.2 Constructor & Destructor Documentation

7.20.2.1 LoRaClass()

```
LoRaClass::LoRaClass ()
```

Definition at line 69 of file LoRa-RP2040.cpp.

7.20.3 Member Function Documentation

7.20.3.1 begin()

```
int LoRaClass::begin (
            long frequency)
```

Definition at line 80 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.2 end()

```
void LoRaClass::end ()
```

Definition at line 149 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.3 beginPacket()

```
int LoRaClass::beginPacket (
            int implicitHeader = false)
```

Definition at line 158 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.4 endPacket()

```
int LoRaClass::endPacket (
            bool async = false)
```

Definition at line 180 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.5 parse_packet()

```
int LoRaClass::parse_packet (
            int size = 0)
```

Definition at line 215 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.6 packetRssi()

```
int LoRaClass::packetRssi ()
```

Definition at line 261 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.7 packetSnr()

```
float LoRaClass::packetSnr ()
```

Definition at line 266 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.8 packetFrequencyError()

```
long LoRaClass::packetFrequencyError ()
```

Definition at line 271 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.9 rssi()

```
int LoRaClass::rssi ()
```

Definition at line 290 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.10 write() [1/2]

```
size_t LoRaClass::write (
            uint8_t byte)  [virtual]
```

Implements Print.

Definition at line 295 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.11 write() [2/2]

```
size_t LoRaClass::write (
            const uint8_t * buffer,
            size_t size)  [virtual]
```

Reimplemented from Print.

Definition at line 300 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.12 available()

```
int LoRaClass::available ()  [virtual]
```

Definition at line 320 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.13 read()

```
int LoRaClass::read () [virtual]
```

Definition at line 325 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.14 peek()

```
int LoRaClass::peek () [virtual]
```

Definition at line 336 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.15 flush()

```
void LoRaClass::flush () [virtual]
```

Reimplemented from Print.

Definition at line 354 of file LoRa-RP2040.cpp.

7.20.3.16 onCadDone()

```
void LoRaClass::onCadDone (
            void(* callback )(bool))
```

Definition at line 369 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.17 onReceive()

```
void LoRaClass::onReceive (
            void(* callback )(int))
```

Definition at line 358 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.18 onTxDone()

```
void LoRaClass::onTxDone (
            void(* callback )())
```

Definition at line 381 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.19 receive()

```
void LoRaClass::receive (
            int size = 0)
```

Definition at line 392 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.20 channelActivityDetection()

```
void LoRaClass::channelActivityDetection (
            void )
```

Definition at line 408 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.21 idle()

```
void LoRaClass::idle ()
```

Definition at line 414 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.22 sleep()

```
void LoRaClass::sleep ()
```

Definition at line 419 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.23 setTxPower()

```
void LoRaClass::setTxPower (
            int level,
            int outputPin = PA_OUTPUT_PA_BOOST_PIN)
```

Definition at line 424 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.24 setFrequency()

```
void LoRaClass::setFrequency (
            long frequency)
```

Definition at line 461 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.25 setSpreadingFactor()

```
void LoRaClass::setSpreadingFactor (
            int sf)
```

Definition at line 477 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.26 setSignalBandwidth()

```
void LoRaClass::setSignalBandwidth (
            long sbw)
```

Definition at line 517 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.27 setCodingRate4()

```
void LoRaClass::setCodingRate4 (
            int denominator)
```

Definition at line 560 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.28 setPreambleLength()

```
void LoRaClass::setPreambleLength (
            long length)
```

Definition at line 573 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.29 setSyncWord()

```
void LoRaClass::setSyncWord (
            int sw)
```

Definition at line 579 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.30 enableCrc()

```
void LoRaClass::enableCrc ()
```

Definition at line 584 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.31 disableCrc()

```
void LoRaClass::disableCrc ()
```

Definition at line 589 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.32 enableInvertIQ()

```
void LoRaClass::enableInvertIQ ()
```

Definition at line 594 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.33 disableInvertIQ()

```
void LoRaClass::disableInvertIQ ()
```

Definition at line 600 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.34 setOCP()

```
void LoRaClass::setOCP (
            uint8_t mA)
```

Definition at line 606 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

7.20.3.35 setGain()

```
void LoRaClass::setGain (
            uint8_t gain)
```

Definition at line 619 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.36 crc()

```
void LoRaClass::crc () [inline]
```

Definition at line 73 of file LoRa-RP2040.h.

Here is the call graph for this function:

7.20.3.37 noCrc()

```
void LoRaClass::noCrc () [inline]
```

Definition at line 74 of file LoRa-RP2040.h.

Here is the call graph for this function:

7.20.3.38 random()

```
uint8_t LoRaClass::random ()
```

Definition at line 645 of file LoRa-RP2040.cpp.

Here is the call graph for this function:

7.20.3.39 set_pins()

```
void LoRaClass::set_pins (
            int ss = LORA_DEFAULT_SS_PIN,
            int reset = LORA_DEFAULT_RESET_PIN,

7.22.1 Detailed Description

Definition at line 9 of file MPU6050_WRAPPER.h.

7.22.2 Constructor & Destructor Documentation

7.22.2.1 MPU6050Wrapper()

```
MPU6050Wrapper::MPU6050Wrapper ()
```

7.22.3 Member Function Documentation

7.22.3.1 init()

```
bool MPU6050Wrapper::init () [override], [virtual]
```

Implements ISensor.

7.22.3.2 read_data()

```
float MPU6050Wrapper::read_data (
            SensorDataTypeIdentifier type) [override], [virtual]
```

Implements ISensor.

7.22.3.3 is_initialized()

```
bool MPU6050Wrapper::is_initialized () const [override], [virtual]
```

Implements ISensor.

7.22.3.4 get_type()

```
SensorType MPU6050Wrapper::get_type () const [override], [virtual]
```

Implements ISensor.

7.22.3.5 configure()

```
bool MPU6050Wrapper::configure (
            const std::map< std::string, std::string > & config) [virtual]
```

Implements ISensor.

7.22.4 Member Data Documentation

7.22.4.1 sensor_

```
MPU6050 MPU6050Wrapper::sensor_ [private]
```

Definition at line 11 of file MPU6050_WRAPPER.h.

7.22.4.2 initialized_

```
bool MPU6050Wrapper::initialized_ = false  [private]
```

Definition at line 12 of file MPU6050_WRAPPER.h.

The documentation for this class was generated from the following file:

- lib/sensors/MPU6050/MPU6050_WRAPPER.h

7.23 NMEAData Class Reference

```
#include <NMEA_data.h>
```

Public Member Functions

7.26 SensorWrapper Class Reference

Manages different sensor types and provides a unified interface for accessing sensor data.

```
#include <ISensor.h>
```

Public Member Functions

- bool sensor_init (SensorType type, i2c_inst_t *i2c=nullptr)

  Initializes a given sensor type on the specified I2C bus.
- bool sensor_configure (SensorType type, const std::map< std::string, std::string > &config)

  Configures an already initialized sensor with supplied settings.
- float sensor_read_data (SensorType sensorType, SensorDataTypeIdentifier dataType)

  Reads a specific data type (e.g., temperature, humidity) from a sensor.

Static Public Member Functions

- static SensorWrapper & get_instance ()

  Provides a global instance of SensorWrapper.

Private Member Functions

- SensorWrapper ()

  Default constructor for SensorWrapper.

Private Attributes

- std::map< SensorType, ISensor * > sensors

7.26.1 Detailed Description

Manages different sensor types and provides a unified interface for accessing sensor data.

Definition at line 43 of file ISensor.h.

7.26.2 Constructor & Destructor Documentation

7.26.2.1 SensorWrapper()

```
SensorWrapper::SensorWrapper () [private], [default]
```

Default constructor for SensorWrapper.

Here is the caller graph for this function:

7.26.3 Member Function Documentation

7.26.3.1 get_instance()

```
SensorWrapper & SensorWrapper::get_instance () [static]
```

Provides a global instance of SensorWrapper.

Returns

A reference to the single SensorWrapper instance.

Definition at line 23 of file ISensor.cpp.

Here is the call graph for this function:

7.26.3.2 sensor_init()

```
bool SensorWrapper::sensor_init (
            SensorType type,
            i2c_inst_t * i2c = nullptr)
```

Initializes a given sensor type on the specified I2C bus.

Parameters

type	The sensor type (LIGHT, ENVIRONMENT, etc.).
i2c	The I2C interface pointer.

Returns

True if initialization succeeded, otherwise false.

Definition at line 39 of file ISensor.cpp.

7.26.3.3 sensor_configure()

```
bool SensorWrapper::sensor_configure (
            SensorType type,
            const std::map< std::string, std::string > & config)
```

Configures an already initialized sensor with supplied settings.

Parameters

type	The sensor type.
config	Key-value pairs for sensor configuration.

Returns

True if the sensor was successfully configured, otherwise false.

Definition at line 63 of file ISensor.cpp.

7.26.3.4 sensor_read_data()

```
float SensorWrapper::sensor_read_data (
            SensorType sensorType,
            SensorDataTypeIdentifier dataType)
```

Reads a specific data type (e.g., temperature, humidity) from a sensor.

Parameters

sensorType	The sensor type.
dataType	The type of data to read (light level, temperature, etc.).

Returns

The requested measurement. Returns 0.0f if sensor not found or uninitialized.

Definition at line 78 of file ISensor.cpp.

7.26.4 Member Data Documentation

7.26.4.1 sensors

```
std::map<SensorType, ISensor*> SensorWrapper::sensors  [private]
```

Definition at line 51 of file ISensor.h.

The documentation for this class was generated from the following files:

- lib/sensors/ISensor.h

8.11.3 Enumeration Type Documentation

8.11.3.1 AlarmId

```
enum AlarmId
```

Alarm ID.

Enumerator

Alarm1	Alarm ID 1.
Alarm2	Alarm ID 2.

Definition at line 104 of file ErriezDS3231.h.

8.11.3.2 Alarm1Type

```
enum Alarm1Type
```

Alarm 1 types enum.

Enumerator

Alarm1EverySecond	Alarm once per second.
Alarm1MatchSeconds	Alarm when seconds match.
Alarm1MatchMinutes	Alarm when minutes and seconds match.
Alarm1MatchHours	Alarm when hours, minutes, and seconds match.
Alarm1MatchDay	Alarm when date, hours, minutes, and seconds match.
Alarm1MatchDate	Alarm when day, hours, minutes, and seconds match.

Definition at line 112 of file ErriezDS3231.h.

8.11.3.3 Alarm2Type

```
enum Alarm2Type
```

Alarm 2 types enum.

Enumerator

Alarm2EveryMinute	Alarm once per minute (00 seconds of every minute)
Alarm2MatchMinutes	Alarm when minutes match.
Alarm2MatchHours	Alarm when hours and minutes match.
Alarm2MatchDay	Alarm when date, hours, and minutes match.
Alarm2MatchDate	Alarm when day, hours, and minutes match.

Definition at line 125 of file ErriezDS3231.h.

8.11.3.4 SquareWave

```
enum SquareWave
```

Squarewave enum.

Enumerator

SquareWaveDisable	SQW disable.
SquareWave1Hz	SQW 1Hz.
SquareWave1024Hz	SQW 1024Hz.
SquareWave4096Hz	SQW 4096Hz.
SquareWave8192Hz	SQW 8192Hz.

Definition at line 137 of file ErriezDS3231.h.

8.13 lib/comms/commands/clock_commands.cpp File Reference

```
#include "communication.h"
#include <time.h>
#include "DS3231.h"
```

Include dependency graph for clock_commands.cpp:

Functions

- Frame handle_time (const std::string &param, OperationType operationType)

  Handler for getting and setting system time.
- Frame handle_timezone_offset (const std::string &param, OperationType operationType)

  Handler for getting and setting timezone offset.
- Frame handle_clock_sync_interval (const std::string &param, OperationType operationType)

  Handler for getting and setting clock synchronization interval.
- Frame handle_get_last_sync_time (const std::string &param, OperationType operationType)

  Handler for getting last clock sync time.

Variables

- DS3231 systemClock

8.17 lib/comms/commands/commands.h File Reference

```
#include <string>
#include <functional>
#include <map>
#include "protocol.h"
```

Include dependency graph for commands.h:

This graph shows which files directly or indirectly include this file:

Functions

- Frame handle_time (const std::string &param, OperationType operationType)

  Handler for getting and setting system time.
- Frame handle_timezone_offset (const std::string &param, OperationType operationType)

  Handler for getting and setting timezone offset.
- Frame handle_clock_sync_interval (const std::string &param, OperationType operationType)

  Handler for getting and setting clock synchronization interval.
- Frame handle_get_last_sync_time (const std::string &param, OperationType operationType)

  Handler for getting last clock sync time.
- Frame handle_get_commands_list (const std::string &param, OperationType operationType)

  Handler for listing all available commands on UART.
- Frame handle_get_build_version (const std::string &param, OperationType operationType)

  Get firmware build version.
- Frame handle_verbosity (const std::string &param, OperationType operationType)

  Handles setting or getting the UART verbosity level.
- Frame handle_enter_bootloader_mode (const std::string &param, OperationType operationType)

  Reboot system to USB firmware loader.
- Frame handle_gps_power_status (const std::string &param, OperationType operationType)

  Handler for controlling GPS module power state.
- Frame handle_enable_gps_uart_passthrough (const std::string &param, OperationType operationType)

Handler for enabling GPS transparent mode (UART pass-through)

- Frame handle_get_rmc_data (const std::string &param, OperationType operationType)

  Handler for retrieving GPS RMC (Recommended Minimum Navigation) data.
- Frame handle_get_gga_data (const std::string &param, OperationType operationType)

  Handler for retrieving GPS GGA (Global Positioning System Fix Data) data.
- Frame handle_get_power_manager_ids (const std::string &param, OperationType operationType)

  Handler for retrieving Power Manager IDs.
- Frame handle_get_voltage_battery (const std::string &param, OperationType operationType)

  Handler for getting battery voltage.
- Frame handle_get_voltage_5v (const std::string &param, OperationType operationType)

  Handler for getting 5V rail voltage.
- Frame handle_get_current_charge_usb (const std::string &param, OperationType operationType)

  Handler for getting USB charge current.
- Frame handle_get_current_charge_solar (const std::string &param, OperationType operationType)

  Handler for getting solar panel charge current.
- Frame handle_get_current_charge_total (const std::string &param, OperationType operationType)

  Handler for getting total charge current.
- Frame handle_get_current_draw (const std::string &param, OperationType operationType)

  Handler for getting system current draw.
- Frame handle_get_last_events (const std::string &param, OperationType operationType)

  Handler for retrieving last N events from the event log.
- Frame hadnle_get_event_count (const std::string &param, OperationType operationType)

  Handler for getting total number of events in the log.
- Frame handle_list_files (const std::string &param, OperationType operationType)

  Handles the list files command.
- Frame handle_file_download (const std::string &param, OperationType operationType)

  Handles the file download command.
- Frame execute_command (uint32_t commandKey, const std::string &param, OperationType operationType)

  Executes a command based on its key.

Variables

- std::map< uint32_t, std::function< Frame(const std::string &, OperationType)> > commandHandlers

  Global map of all command handlers.

Here is the caller graph for this function:

8.35.1.2 on_receive()

```
void on_receive (
            int packetSize)
```

Callback function for handling received LoRa packets.

Parameters

packetSize	The size of the received packet.

Reads the received LoRa packet, extracts metadata, validates the lora_address_remote and local addresses, extracts the frame data, and processes it. Prints raw hex values for debugging.

Definition at line 15 of file receive.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.35.1.3 handle_uart_input()

```
void handle_uart_input ()
```

Handles UART input.

Reads characters from the UART port, appends them to a buffer, and processes the buffer when a newline character is received.

Definition at line 76 of file receive.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.35.1.8 split_and_send_message()

```
void split_and_send_message (
            const uint8_t * data,
            size_t length)
```

Sends a large packet using LoRa.

Parameters

data	The data to send.
length	The length of the data.

Splits the data into chunks of MAX_PKT_SIZE and sends each chunk as a separate LoRa packet.

Definition at line 59 of file send.cpp.

8.35.1.9 frame_process()

```
void frame_process (
            const std::string & data,
            Interface interface)
```

Executes a command based on the command key and the parameter.

Parameters

data	The Frame data in string format.

Decodes the frame data, extracts the command key, and executes the corresponding command. Sends the response frame. If an error occurs, an error frame is built and sent.

Definition at line 100 of file frame.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.35.1.10 frame_encode()

```
std::string frame_encode (
            const Frame & frame)
```

Encodes a Frame instance into a string.

Parameters

frame	The Frame instance to encode.

Returns

The Frame encoded as a string.

The encoded string includes the frame direction, operation type, group, command, value, and unit, all delimited by the DELIMITER character. The string is encapsulated by FRAME_BEGIN and FRAME_END.

Definition at line 19 of file frame.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.35.1.11 frame_decode()

```
Frame frame_decode (
            const std::string & data)
```

Converts a string into a Frame instance.

Parameters

data	The Frame data as a string.

Returns

The Frame instance.

Exceptions

std::runtime_error	if the frame header is invalid.

Parses the input string, extracting the frame direction, operation type, group, command, value, and unit. If an error occurs during parsing, an error message is printed to the UART, an error frame is built and sent, and the exception is re-thrown.

Definition at line 44 of file frame.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.35.1.12 frame_build()

```
Frame frame_build (
            ExecutionResult result,
            uint8_t group,
            uint8_t command,
            const std::string & value,
            const ValueUnit unitType)
```

Builds a Frame instance.

Parameters

result	The execution result.
group	The group ID.
command	The command ID.
value	The value.
unitType	The value unit type.

Returns

The Frame instance.

Constructs a Frame instance based on the provided parameters. The frame direction and operation type are set based on the execution result.

Definition at line 135 of file frame.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.35.1.13 determine_unit()

```
std::string determine_unit (
            uint8_t group,
            uint8_t command)
```

8.37 lib/comms/frame.cpp File Reference

Implements functions for encoding, decoding, building, and processing Frames.

`#include "communication.h"`

Include dependency graph for frame.cpp:

Typedefs

- using CommandHandler = std::function<std::string(const std::string&, OperationType)>

Functions

- std::string frame_encode (const Frame &frame)

  Encodes a Frame instance into a string.
- Frame frame_decode (const std::string &data)

  Converts a string into a Frame instance.
- void frame_process (const std::string &data, Interface interface)

  Executes a command based on the command key and the parameter.
- Frame frame_build (ExecutionResult result, uint8_t group, uint8_t command, const std::string &value, const ValueUnit unitType)

  Builds a Frame instance.

Variables

- std::map< uint32_t, CommandHandler > commandHandlers

  Global map of all command handlers.
- volatile uint16_t eventRegister

8.37.1 Detailed Description

Implements functions for encoding, decoding, building, and processing Frames.

Definition in file frame.cpp.

8.37.2 Typedef Documentation

8.37.2.1 CommandHandler

```
using CommandHandler = std::function<std::string(const std::string&, OperationType)>
```

Definition at line 3 of file frame.cpp.

8.37.3 Function Documentation

8.37.3.1 frame_encode()

```
std::string frame_encode (
            const Frame & frame)
```

Encodes a Frame instance into a string.

Parameters

frame	The Frame instance to encode.

Returns

The Frame encoded as a string.

The encoded string includes the frame direction, operation type, group, command, value, and unit, all delimited by the DELIMITER character. The string is encapsulated by FRAME_BEGIN and FRAME_END.

Definition at line 19 of file frame.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.37.3.2 frame_decode()

```
Frame frame_decode (
            const std::string & data)
```

Converts a string into a Frame instance.

Parameters

data	The Frame data as a string.

Returns

The Frame instance.

Exceptions

std::runtime_error	if the frame header is invalid.

Parses the input string, extracting the frame direction, operation type, group, command, value, and unit. If an error occurs during parsing, an error message is printed to the UART, an error frame is built and sent, and the exception is re-thrown.

Definition at line 44 of file frame.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.37.3.3 frame_process()

```
void frame_process (
            const std::string & data,
            Interface interface)
```

Executes a command based on the command key and the parameter.

Parameters

data	The Frame data in string format.

Decodes the frame data, extracts the command key, and executes the corresponding command. Sends the response frame. If an error occurs, an error frame is built and sent.

Definition at line 100 of file frame.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.37.3.4 frame_build()

```
Frame frame_build (
            ExecutionResult result,
            uint8_t group,
            uint8_t command,
            const std::string & value,
            const ValueUnit unitType)
```

Builds a Frame instance.

Parameters

result	The execution result.
group	The group ID.
command	The command ID.
value	The value.
unitType	The value unit type.

Returns

The Frame instance.

Constructs a Frame instance based on the provided parameters. The frame direction and operation type are set based on the execution result.

Definition at line 135 of file frame.cpp.

Here is the call graph for this function:

8.47.2 Function Documentation

8.47.2.1 exception_type_to_string()

```
std::string exception_type_to_string (
            ExceptionType type)
```

Converts an ExceptionType to a string.

Parameters

type	The ExceptionType to convert.

Returns

The string representation of the ExceptionType.

Definition at line 14 of file utils_converters.cpp.

Here is the caller graph for this function:

8.47.2.2 operation_type_to_string()

```
std::string operation_type_to_string (
            OperationType type)
```

Converts an OperationType to a string.

Parameters

type	The OperationType to convert.

Returns

The string representation of the OperationType.

Definition at line 50 of file utils_converters.cpp.

Here is the caller graph for this function:

8.47.2.3 string_to_operation_type()

```
OperationType string_to_operation_type (
            const std::string & str)
```

Converts a string to an OperationType.

Parameters

str	The string to convert.

Returns

The OperationType corresponding to the string. Defaults to GET if the string is not recognized.

Definition at line 67 of file utils_converters.cpp.

Here is the caller graph for this function:

8.47.2.4 hex_string_to_bytes()

```
std::vector< uint8_t > hex_string_to_bytes (
            const std::string & hexString)
```

Converts a hex string to a vector of bytes.

Parameters

hexString	The hex string to convert.

Returns

A vector of bytes representing the hex string.

Definition at line 81 of file utils_converters.cpp.

Here is the caller graph for this function:

8.47.2.5 value_unit_type_to_string()

```
std::string value_unit_type_to_string (
            ValueUnit unit)
```

Converts a ValueUnit to a string.

Parameters

unit	The ValueUnit to convert.

Returns

The string representation of the ValueUnit.

Definition at line 31 of file utils_converters.cpp.

Here is the caller graph for this function:

8.47.3 Variable Documentation

8.49 lib/comms/receive.cpp File Reference

Implements functions for receiving and processing data, including LoRa and UART input.

`#include "communication.h"`

Include dependency graph for receive.cpp:

Functions

- void on_receive (int packetSize)

  Callback function for handling received LoRa packets.
- void handle_uart_input ()

  Handles UART input.

8.49.1 Detailed Description

Implements functions for receiving and processing data, including LoRa and UART input.

Definition in file receive.cpp.

8.49.2 Function Documentation

8.49.2.1 on_receive()

```
void on_receive (
            int packetSize)
```

Callback function for handling received LoRa packets.

Parameters

packetSize	The size of the received packet.

Reads the received LoRa packet, extracts metadata, validates the lora_address_remote and local addresses, extracts the frame data, and processes it. Prints raw hex values for debugging.

Definition at line 15 of file receive.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.49.2.2 handle_uart_input()

```
void handle_uart_input ()
```

Handles UART input.

Reads characters from the UART port, appends them to a buffer, and processes the buffer when a newline character is received.

Definition at line 76 of file receive.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.50 receive.cpp

Go to the documentation of this file.

```
#include "communication.h"

void on_receive(int packetSize) {

8.51 lib/comms/send.cpp File Reference

Implements functions for sending data, including LoRa messages and Frames.

`#include "communication.h"`

Include dependency graph for send.cpp:

Functions

- void send_message (string outgoing)

  Sends a message using LoRa.
- void send_frame_lora (const Frame &frame)
- void send_frame_uart (const Frame &frame)
- void send_frame (const Frame &frame)
- void split_and_send_message (const uint8_t *data, size_t length)

  Sends a large packet using LoRa.

8.51.1 Detailed Description

Implements functions for sending data, including LoRa messages and Frames.

Definition in file send.cpp.

8.51.2 Function Documentation

8.51.2.1 send_message()

```
void send_message (
            string outgoing)
```

Sends a message using LoRa.

Parameters

outgoing	The message to send.

Converts the outgoing string to a C-style string, adds destination and local addresses, and sends the message using LoRa. Prints a log message to the UART.

Definition at line 15 of file send.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.51.2.2 send_frame_lora()

```
void split_and_send_message (
            const uint8_t * data,
            size_t length)
```

Sends a large packet using LoRa.

Parameters

data	The data to send.
length	The length of the data.

Splits the data into chunks of MAX_PKT_SIZE and sends each chunk as a separate LoRa packet.

Definition at line 59 of file send.cpp.

8.52 send.cpp

Go to the documentation of this file.

```
#include "communication.h"

void send_message(string outgoing)
{
    int n = outgoing.length();
    char send[n + 1];
    strcpy(send, outgoing.c_str());

    LoRa.beginPacket();        // start packet
    LoRa.write(lora_address_remote);  // add destination address
    LoRa.write(lora_address_local); // add sender address
    LoRa.print(send);          // add payload
    LoRa.endPacket(false);     // finish packet and send it

    std::string messageToLog = "Sent message of size " + std::to_string(n);
    messageToLog += " to 0x" + std::to_string(lora_address_remote);

        LoRa.endPacket();
        offset += chunkSize;
        sleep_ms(100);
    }
}

```

8.53 lib/comms/utils_converters.cpp File Reference

Implements utility functions for converting between different data types.

`#include "communication.h"`

Include dependency graph for utils_converters.cpp:

Functions

- std::string exception_type_to_string (ExceptionType type)

  Converts an ExceptionType to a string.
- std::string value_unit_type_to_string (ValueUnit unit)

  Converts a ValueUnit to a string.
- std::string operation_type_to_string (OperationType type)

  Converts an OperationType to a string.
- OperationType string_to_operation_type (const std::string &str)

  Converts a string to an OperationType.
- std::vector< uint8_t > hex_string_to_bytes (const std::string &hexString)

  Converts a hex string to a vector of bytes.

8.53.1 Detailed Description

Implements utility functions for converting between different data types.

Definition in file utils_converters.cpp.

8.53.2 Function Documentation

8.53.2.1 exception_type_to_string()

```
std::string exception_type_to_string (
            ExceptionType type)
```

Converts an ExceptionType to a string.

Parameters

type	The ExceptionType to convert.

Returns

The string representation of the ExceptionType.

Definition at line 14 of file utils_converters.cpp.

Here is the caller graph for this function:

8.53.2.2 value_unit_type_to_string()

```
std::string value_unit_type_to_string (
            ValueUnit unit)
```

Converts a ValueUnit to a string.

Parameters

unit	The ValueUnit to convert.

Returns

The string representation of the ValueUnit.

Definition at line 31 of file utils_converters.cpp.

Here is the caller graph for this function:

8.53.2.3 operation_type_to_string()

```
std::string operation_type_to_string (
            OperationType type)
```

Converts an OperationType to a string.

Parameters

type	The OperationType to convert.

Returns

The string representation of the OperationType.

Definition at line 50 of file utils_converters.cpp.

Here is the caller graph for this function:

8.53.2.4 string_to_operation_type()

```
OperationType string_to_operation_type (
            const std::string & str)
```

Converts a string to an OperationType.

Parameters

str	The string to convert.

Returns

The OperationType corresponding to the string. Defaults to GET if the string is not recognized.

Definition at line 67 of file utils_converters.cpp.

Here is the caller graph for this function:

8.53.2.5 hex_string_to_bytes()

```
std::vector< uint8_t > hex_string_to_bytes (
            const std::string & hexString)
```

Converts a hex string to a vector of bytes.

Parameters

hexString	The hex string to convert.

Returns

A vector of bytes representing the hex string.

Definition at line 81 of file utils_converters.cpp.

Here is the caller graph for this function:

```

Include dependency graph for event_manager.cpp:

Functions

- void check_power_events (PowerManager &pm)

  Checks power statuses and triggers events based on voltage trends.

Variables

- volatile uint16_t eventLogId = 0

  Global event log ID counter.
- static PowerEvent lastPowerState = PowerEvent::LOW_BATTERY

  Stores the last known power state.
- static constexpr float FALL_RATE_THRESHOLD = -0.02f

  Threshold for detecting a falling voltage rate.
- static constexpr int FALLING_TREND_REQUIRED = 3

  Number of consecutive falling voltage readings required to trigger a power falling event.
- static constexpr float VOLTAGE_LOW_THRESHOLD = 4.7f

  Voltage threshold for detecting a low battery condition.
- static constexpr float VOLTAGE_OVERCHARGE_THRESHOLD = 5.3f

  Voltage threshold for detecting an overcharge condition.
- static int fallingTrendCount = 0

  Counter for consecutive falling voltage readings.
- bool lastSolarState = false

  Stores the last known solar charging state.
- bool lastUSBState = false

  Stores the last known USB connection state.
- DS3231 systemClock

  External declaration of the system clock.
- EventManagerImpl eventManager

  Global instance of the EventManager implementation.

8.55.1 Detailed Description

Implements the event management system for the Kubisat firmware.

This file contains the implementation for logging events, managing event storage, and checking for specific events such as power status changes.

Definition in file event_manager.cpp.

8.55.2 Function Documentation

8.55.2.1 check_power_events()

```
void check_power_events (
            PowerManager & pm)
```

Checks power statuses and triggers events based on voltage trends.

Parameters

pm	Reference to the PowerManager object.

Monitors the 5V voltage level, detects falling voltage trends, and triggers events for low battery, overcharge, and normal power conditions. Also checks solar charging and USB connection states.

Definition at line 139 of file event_manager.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.55.3 Variable Documentation

8.55.3.1 eventLogId

```
volatile uint16_t eventLogId = 0
```

Global event log ID counter.

Definition at line 20 of file event_manager.cpp.

8.55.3.2 lastPowerState

```
PowerEvent lastPowerState = PowerEvent::LOW_BATTERY  [static]
```

Stores the last known power state.

Definition at line 25 of file event_manager.cpp.

8.55.3.3 FALL_RATE_THRESHOLD

```
float FALL_RATE_THRESHOLD = -0.02f  [static], [constexpr]
```

Threshold for detecting a falling voltage rate.

Definition at line 30 of file event_manager.cpp.

8.55.3.4 FALLING_TREND_REQUIRED

```
int FALLING_TREND_REQUIRED = 3  [static], [constexpr]
```

Number of consecutive falling voltage readings required to trigger a power falling event.

Definition at line 35 of file event_manager.cpp.

8.55.3.5 VOLTAGE_LOW_THRESHOLD

```
float VOLTAGE_LOW_THRESHOLD = 4.7f  [static], [constexpr]
```

Voltage threshold for detecting a low battery condition.

Definition at line 40 of file event_manager.cpp.

8.55.3.6 VOLTAGE_OVERCHARGE_THRESHOLD

```
float VOLTAGE_OVERCHARGE_THRESHOLD = 5.3f  [static], [constexpr]
```

Voltage threshold for detecting an overcharge condition.

Definition at line 45 of file event_manager.cpp.

8.55.3.7 fallingTrendCount

```
int fallingTrendCount = 0  [static]
```

Counter for consecutive falling voltage readings.

Definition at line 50 of file event_manager.cpp.

8.55.3.8 lastSolarState

```
bool lastSolarState = false
```

Stores the last known solar charging state.

Definition at line 55 of file event_manager.cpp.

8.55.3.9 lastUSBState

```
bool lastUSBState = false
```

Stores the last known USB connection state.

Definition at line 60 of file event_manager.cpp.

8.55.3.10 systemClock

```
DS3231 systemClock  [extern]
```

External declaration of the system clock.

8.55.3.11 eventManager

```
EventManagerImpl eventManager
```

Global instance of the EventManager implementation.

Global instance of the EventManagerImpl class.

Definition at line 70 of file event_manager.cpp.

Functions

- class EventLog __attribute__ ((packed))
- std::string to_string () const

  Converts the EventLog to a string representation.
- void check_power_events (PowerManager &pm)

  Checks power statuses and triggers events based on voltage trends.

Variables

- uint16_t id

  Sequence number.
- uint32_t timestamp

  Unix timestamp or system time.
- uint8_t group

  Event group identifier.
- uint8_t event

  Specific event identifier.
- class EventManager __attribute__
- EventManagerImpl eventManager

  Global instance of the EventManagerImpl class.

8.57.1 Macro Definition Documentation

8.57.1.1 EVENT_BUFFER_SIZE

```
#define EVENT_BUFFER_SIZE 1000
```

Definition at line 9 of file event_manager.h.

8.57.2 Enumeration Type Documentation

8.57.2.1 EventGroup

```
enum class EventGroup : uint8_t [strong]
```

Enumerator

SYSTEM	
POWER	
COMMS	
GPS	
CLOCK	

Definition at line 12 of file event_manager.h.

8.57.2.2 SystemEvent

```
enum class SystemEvent : uint8_t [strong]
```

Enumerator

BOOT	
SHUTDOWN	
WATCHDOG_RESET	
CORE1_START	
CORE1_STOP	

Definition at line 21 of file event_manager.h.

8.57.2.3 PowerEvent

```
enum class PowerEvent : uint8_t [strong]
```

Enumerator

LOW_BATTERY	
OVERCHARGE	
POWER_FALLING	
POWER_NORMAL	
SOLAR_ACTIVE	
SOLAR_INACTIVE	
USB_CONNECTED	
USB_DISCONNECTED	

Definition at line 30 of file event_manager.h.

8.57.2.4 CommsEvent

```
enum class CommsEvent : uint8_t [strong]
```

Enumerator

RADIO_INIT	
RADIO_ERROR	
MSG_RECEIVED	
MSG_SENT	
UART_ERROR	

Definition at line 42 of file event_manager.h.

8.57.2.5 GPSEvent

```
enum class GPSEvent : uint8_t [strong]
```

Enumerator

LOCK	
LOST	
ERROR	
POWER_ON	
POWER_OFF	
DATA_READY	
PASS_THROUGH_START	
PASS_THROUGH_END	

Definition at line 51 of file event_manager.h.

8.57.2.6 ClockEvent

```
enum class ClockEvent : uint8_t [strong]
```

Enumerator

CHANGED	
GPS_SYNC	

Definition at line 63 of file event_manager.h.

8.57.3 Function Documentation

8.57.3.1 __attribute__()

```
class EventLog __attribute__ (
            (packed) )
```

8.57.3.2 to_string()

```
std::string __attribute__::to_string () const
```

Converts the EventLog to a string representation.

Returns

A string representation of the EventLog.

Definition at line 10 of file event_manager.h.

8.57.3.3 check_power_events()

```
void check_power_events (
            PowerManager & pm)
```

Checks power statuses and triggers events based on voltage trends.

Parameters

pm	Reference to the PowerManager object.
pm	Reference to the PowerManager object.

Monitors the 5V voltage level, detects falling voltage trends, and triggers events for low battery, overcharge, and normal power conditions. Also checks solar charging and USB connection states.

Definition at line 139 of file event_manager.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.57.4 Variable Documentation

8.57.4.1 id

```
uint16_t id
```

Sequence number.

Definition at line 1 of file event_manager.h.

8.57.4.2 timestamp

```
uint32_t timestamp
```

Unix timestamp or system time.

Definition at line 2 of file event_manager.h.

8.57.4.3 group

```
uint8_t group
```

Event group identifier.

Definition at line 3 of file event_manager.h.

8.57.4.4 event

```
uint8_t event
```

Specific event identifier.

Definition at line 4 of file event_manager.h.

8.57.4.5 __attribute__

```
class EventManager __attribute__
```

8.57.4.6 eventManager

```
EventManagerImpl eventManager [extern]
```

Global instance of the EventManagerImpl class.

Global instance of the EventManagerImpl class.

Definition at line 70 of file event_manager.cpp.

8.71.1 Detailed Description

Implementation of the INA3221 power monitor driver.

This file contains the implementation for the INA3221 triple-channel power monitor, providing functionality for voltage, current, and power monitoring with alert capabilities.

Definition in file INA3221.cpp.

Include dependency graph for storage.cpp:

Functions

- bool fs_init (void)

  Initializes the file system on the SD card.

8.115.1 Detailed Description

Implements file system operations for the Kubisat firmware.

This file contains functions for initializing the file system, opening, writing, reading, and closing files.

Definition in file storage.cpp.

8.115.2 Function Documentation

8.115.2.1 fs_init()

```
bool fs_init (
            void )
```

Initializes the file system on the SD card.

Returns

True if initialization was successful, false otherwise.

Mounts the littlefs file system on the SD card. If mounting fails, it formats the SD card with littlefs and then attempts to mount again.

Definition at line 23 of file storage.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

#include "pico/sync.h"
#include <vector>
#include <queue>
```

Include dependency graph for utils.cpp:

Functions

- std::string get_level_color (VerbosityLevel level)

  Gets ANSI color code for verbosity level.
- std::string get_level_prefix (VerbosityLevel level)

  Gets text prefix for verbosity level.
- void uart_print (const std::string &msg, VerbosityLevel level, bool logToFile, uart_inst_t *uart)

  Prints a message to the UART with a timestamp and core number.
- uint16_t crc16 (const uint8_t *data, size_t length)

  Calculates the CRC16 checksum of the given data.

Variables

- static mutex_t uart_mutex

  Mutex for UART access protection.
- VerbosityLevel g_uart_verbosity = VerbosityLevel::INFO

  Global verbosity level setting.

8.119.1 Detailed Description

Implementation of utility functions for the Kubisat firmware.

Definition in file utils.cpp.

8.119.2 Function Documentation

8.119.2.1 get_level_color()

```
std::string get_level_color (
            VerbosityLevel level)
```

Gets ANSI color code for verbosity level.

Parameters

level	The verbosity level

Returns

ANSI color escape sequence

Definition at line 26 of file utils.cpp.

Here is the caller graph for this function:

8.119.2.2 get_level_prefix()

```
std::string get_level_prefix (
            VerbosityLevel level)
```

Gets text prefix for verbosity level.

Parameters

level	The verbosity level

Returns

Text prefix for the level

Definition at line 43 of file utils.cpp.

Here is the caller graph for this function:

8.119.2.3 uart_print()

```
void uart_print (
            const std::string & msg,
            VerbosityLevel level,
            bool logToFile,
            uart_inst_t * uart)
```

Prints a message to the UART with a timestamp and core number.

Prints a message to UART with timestamp and formatting.

Parameters

msg	The message to print.
logToFile	A flag indicating whether to log the message to a file (currently not implemented).

uart	The UART instance to use for printing.

Prints the given message to the specified UART, prepending it with a timestamp and the core number. Uses a mutex to ensure thread-safe access to the UART.

Definition at line 62 of file utils.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

8.119.2.4 crc16()

```
uint16_t crc16 (
            const uint8_t * data,
            size_t length)
```

Calculates the CRC16 checksum of the given data.

Calculates CRC16 checksum.

Parameters

data	A pointer to the data buffer.
length	The length of the data in bytes.

Returns

The CRC16 checksum.

Calculates the CRC16 checksum using the standard algorithm.

Definition at line 97 of file utils.cpp.

8.119.3 Variable Documentation

8.119.3.1 uart_mutex

```
mutex_t uart_mutex  [static]
```

Mutex for UART access protection.

Definition at line 14 of file utils.cpp.

8.119.3.2 g_uart_verbosity

```
VerbosityLevel g_uart_verbosity = VerbosityLevel::INFO
```

Global verbosity level setting.

Global verbosity level setting for UART output.

Definition at line 18 of file utils.cpp.

8.121.3.1 VerbosityLevel

```
enum class VerbosityLevel [strong]
```

Verbosity levels for logging system.

Enumerator

SILENT	No output
ERROR	Only critical errors
WARNING	Warnings and errors
INFO	Normal operation information
DEBUG	Detailed debug information
EVENT	Events

Definition at line 31 of file utils.h.

8.121.4 Function Documentation

8.121.4.1 uart_print()

```
void uart_print (
            const std::string & msg,
            VerbosityLevel level,
            bool logToFile,
            uart_inst_t * uart)
```

Prints a message to UART with timestamp and formatting.

Parameters

msg	The message to print
level	Message verbosity level
logToFile	Whether to store the message in log storage
uart	The UART port to use

Prints a message to UART with timestamp and formatting.

Parameters

msg	The message to print.
logToFile	A flag indicating whether to log the message to a file (currently not implemented).
uart	The UART instance to use for printing.

Prints the given message to the specified UART, prepending it with a timestamp and the core number. Uses a mutex to ensure thread-safe access to the UART.

Definition at line 62 of file utils.cpp.

Here is the call graph for this function:

Here is the caller graph for this function:

```
uint16_t crc16 (
            const uint8_t * data,
            size_t length)
```

Calculates CRC16 checksum.

Parameters

data	Pointer to data buffer
length	Length of data in bytes

Returns

Calculated CRC16 value

Calculates CRC16 checksum.

Parameters

data	A pointer to the data buffer.
length	The length of the data in bytes.

Returns

The CRC16 checksum.

Calculates the CRC16 checksum using the standard algorithm.

Definition at line 97 of file utils.cpp.

8.121.5 Variable Documentation

8.121.5.1 g_uart_verbosity

```
VerbosityLevel g_uart_verbosity [extern]
```

Global verbosity level setting for UART output.

Controls which messages are displayed:

- SILENT (0): No output
- ERROR (1): Only errors
- WARNING (2): Warnings and errors
- INFO (3): Normal operation information
- DEBUG (4): Detailed debug information

Note

Can be changed at runtime through the command interface
